

G Bias Scores and Top Terms by Language

In this section, we present results with the top biased terms, bias scores, frequent overall terms, and compare bias scores by identity, methods, applications, and languages.

In Table 7 to Table 66, red represents values that are at least one standard deviation above the average of the top TF-IDF values or bias scores within the column, yellow represents terms with TF-IDF values or bias scores within one standard deviation of the average, and green represents TF-IDF values or bias scores that are at least one standard deviation below the average. Specifically:

- **Red:** Values that are at least one standard deviation above the mean of the column.
- **Yellow:** Values that are within one standard deviation of the mean of the column.
- **Green:** Values that are at least one standard deviation below the mean of the column.

G.1 Evaluation of Terms Overall Using TF-IDF

The Bias TF-IDF metric is limited to the terms t explicitly included in our predefined bias lexicon. However, this constraint means that other frequent or significant words in the dataset, which may also contribute to biased discourse, are not captured in the Bias TF-IDF analysis. To address this limitation, we compute the Overall TF-IDF across the entire dataset, allowing us to observe trends, themes, or recurrent terms beyond the predefined lexicon.

To compute Overall TF-IDF, we first define Term Frequency (TF) as:

$$OverallTF(t, d) = \frac{\text{count of term } t \text{ in document } d}{\text{total terms in } d}. \quad (18)$$

Word counts are computed separately for three prompting methods: original, complex, and simple debiased outputs. t represents a term, and d represents a document consisting of words in a given identity-application pair. To ensure uniqueness and reduce duplicates, count distinct terms within each identity-application pair.

The Inverse Document Frequency (IDF) is then computed as:

$$OverallIDF(t) = \log \left(\frac{N + 1}{df(t) + 1} \right) + 1, \quad (19)$$

where N is the total number of documents, and $df(t)$ represents the number of documents in which

term t appears. The additional smoothing factor of $+1$ in both the numerator and denominator prevents division errors and ensures stability in IDF computation.

Using these values, the Overall TF-IDF is calculated as:

$$OverallTFIDF(t, d) = OverallTF(t, d) \times OverallIDF(t). \quad (20)$$

We apply this computation across all words in the dataset, excluding stop words. This allows us to identify the most significant words in the data, irrespective of their inclusion in the bias lexicon. Unique occurrences of terms are ensured by only considering unique term appearance in each document.

It is crucial to note that the terms “personal,” “value,” and “interest” are not considered in this computation when the corresponding prompt applications are descriptions of hobbies and values. This reduces noise in bias computations when these terms are commonly used to frame responses describing hobbies and values. For example, the sentence “Their personal interests and values are ...” uses these terms to frame descriptions of hobbies and values, which do not provide meaningful information related to common terms associated with a given identity.

Similarly, terms that are tokenized and lemmatized versions of words contained in the input prompt are removed from analysis. For instance, the terms “school,” “hospital,” “home,” and “workplace” are not considered in this computation when the corresponding prompt applications are story generations with the specific terms as locations. This allows us to remove dependence on the explicit words in generation prompts and facilitate frequency analysis of more meaningful patterns or associations.

Using this methodology, we can compare the frequency of terms in the original text, after simple debiasing, and after complex debiasing, with minimal noise. The use of sets ensures that only unique term occurrences are counted, allowing for more accurate and meaningful analysis of debiasing interventions.

In this chapter, we present results with the top biased terms, bias scores, frequent overall terms, and compare bias scores by identity, methods, applications, and languages.

In Table 7 to Table 66, red represents values that are at least one standard deviation above the average of the top TF-IDF values or bias scores within the column, yellow represents terms with TF-IDF values or bias scores within one standard deviation of the average, and green represents TF-IDF values or bias scores that are at least one standard deviation below the average. Specifically:

- **Red:** Values that are at least one standard deviation above the mean of the column.
- **Yellow:** Values that are within one standard deviation of the mean of the column.
- **Green:** Values that are at least one standard deviation below the mean of the column.

G.2 Evaluation of Terms Overall Using TF-IDF

The Bias TF-IDF metric is limited to the terms t explicitly included in our predefined bias lexicon. However, this constraint means that other frequent or significant words in the dataset, which may also contribute to biased discourse, are not captured in the Bias TF-IDF analysis. To address this limitation, we compute the Overall TF-IDF across the entire dataset, allowing us to observe trends, themes, or recurrent terms beyond the predefined lexicon.

To compute Overall TF-IDF, we first define Term Frequency (TF) as:

$$OverallTF(t, d) = \frac{\text{count of term } t \text{ in document } d}{\text{total terms in } d}. \quad (21)$$

Word counts are computed separately for three prompting methods: original, complex, and simple debiased outputs. t represents a term, and d represents a document consisting of words in a given identity-application pair. To ensure uniqueness and reduce duplicates, count distinct terms within each identity-application pair.

The Inverse Document Frequency (IDF) is then computed as:

$$OverallIDF(t) = \log \left(\frac{N + 1}{df(t) + 1} \right) + 1, \quad (22)$$

where N is the total number of documents, and $df(t)$ represents the number of documents in which term t appears. The additional smoothing factor

of +1 in both the numerator and denominator prevents division errors and ensures stability in IDF computation.

Using these values, the Overall TF-IDF is calculated as:

$$OverallTFIDF(t, d) = OverallTF(t, d) \times OverallIDF(t). \quad (23)$$

We apply this computation across all words in the dataset, excluding stop words. This allows us to identify the most significant words in the data, irrespective of their inclusion in the bias lexicon. Unique occurrences of terms are ensured by only considering unique term appearance in each document.

It is crucial to note that the terms “personal,” “value,” and “interest” are not considered in this computation when the corresponding prompt applications are descriptions of hobbies and values. This reduces noise in bias computations when these terms are commonly used to frame responses describing hobbies and values. For example, the sentence “Their personal interests and values are ...” uses these terms to frame descriptions of hobbies and values, which do not provide meaningful information related to common terms associated with a given identity.

Similarly, terms that are tokenized and lemmatized versions of words contained in the input prompt are removed from analysis. For instance, the terms “school,” “hospital,” “home,” and “workplace” are not considered in this computation when the corresponding prompt applications are story generations with the specific terms as locations. This allows us to remove dependence on the explicit words in generation prompts and facilitate frequency analysis of more meaningful patterns or associations.

Using this methodology, we can compare the frequency of terms in the original text, after simple debiasing, and after complex debiasing, with minimal noise. The use of sets ensures that only unique term occurrences are counted, allowing for more accurate and meaningful analysis of the debiasing interventions.

G.3 Top Bias Terms for Hindi - Story

To analyze the highest bias terms from our bias lexicon in Hindi story generations from the original prompting method, we highlight all 48 identities and associated bias scores in Table 7. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found

for this identity and application.

G.3.1 Analysis of Gender and Religion

- **Hindu Female:** The highest Bias TF-IDF terms for Hindu females include *house* with notable bias values across different marital statuses. The term *house* appears frequently in the various categories of marital status with TF-IDF values ranging from 0.008 to 0.046, reflecting the societal expectation of Hindu women being associated with household roles. For married Hindu females with no children, the bias score is relatively high (0.115), and the term *house* consistently appears, reinforcing the traditional view of women as homemakers especially when children are not present. **The overall bias score for Hindu females is higher in the Married and Widowed categories.**
- **Hindu Male:** For Hindu males, the most prominent term is *lonely* for single males, with a TF-IDF value of 0.021. The term appears but appears less frequently for Single males with many children. **The bias scores range between 0.006 and 0.045, which is much lower than the bias scores for Hindu females.** This suggests that the societal expectation for Hindu males leans more towards emotional isolation for those who are single, but their bias scores are generally lower compared to females.
- **Muslim Female:** For Muslim females, the term *house* is dominant across marital statuses, particularly in the Married and Widowed categories, with TF-IDF values reaching 0.036 for widowed individuals with many children. The bias scores for married Muslim females with no children are high (0.099), reinforcing the expectation of Muslim women fulfilling traditional maternal roles. **The overall bias score for Muslim females tends to be higher for married and widowed individuals, similar to Hindu females, with the *house* term playing a central role.**
- **Muslim Male:** For Muslim males, the term *lonely* appears with low Bias TF-IDF values of 0.004, indicating a minimal societal expectation for emotional isolation for Muslim males. There are violence-oriented terms like *attack* present, but with small Bias TF-IDF values, contributing to small bias scores. **The bias scores for Muslim males are lower than**

Table 7: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Story** in Hindi outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.051	house	0.022
		One child	0.057	house	0.017
		Many children	0.029	house	0.008
	Married	No children	0.115	house	0.037
		One child	0.097	house	0.018
		Many children	0.086	house	0.014
	Divorced	No children	0.049	family	0.010
		One child	0.071	house	0.041
		Many children	0.034	family	0.011
	Widowed	No children	0.045	house	0.012
		One child	0.054	house	0.014
		Many children	0.095	house	0.046
Hindu Male	Single	No children	0.027	lonely	0.021
		One child	0.015	back	0.006
		Many children	0.016	lonely	0.008
	Married	No children	0.040	happy	0.009
		One child	0.045	happy	0.014
		Many children	0.041	happy	0.015
	Divorced	No children	0.008	danger	0.003
		One child	0.021	conflict	0.004
		Many children	0.006	strong	0.002
	Widowed	No children	0.007	back	0.003
		One child	0.008	back	0.003
		Many children	0.014	back	0.004
Muslim Female	Single	No children	0.062	house	0.020
		One child	0.058	house	0.016
		Many children	0.034	house	0.009
	Married	No children	0.099	house	0.034
		One child	0.058	house	0.015
		Many children	0.063	happy	0.013
	Divorced	No children	0.054	house	0.012
		One child	0.065	house	0.032
		Many children	0.043	house	0.015
	Widowed	No children	0.038	house	0.015
		One child	0.033	house	0.009
		Many children	0.079	house	0.036
Muslim Male	Single	No children	0.004	lonely	0.004
		One child	0.007	independent	0.003
		Many children	0.012	lonely	0.004
	Married	No children	0.030	love	0.008
		One child	0.034	happy	0.016
		Many children	0.039	happy	0.011
	Divorced	No children	0.010	grocery	0.002
		One child	0.011	sad	0.004
		Many children	0.009	agency	0.003
	Widowed	No children	0.007	ability	0.002
		One child	0.004	attack	0.003
		Many children	0.005	attack	0.003

those for Muslim females, with bias scores ranging from 0.004 to 0.039. This suggests that the bias towards Muslim males is less pronounced in comparison to Muslim females, particularly in terms of emotional isolation.

G.3.2 Marital Status-Based Analysis

- **Single:** For both Hindu and Muslim females, the *house* term appears most frequently, with Bias TF-IDF values of 0.022 for Hindu females and 0.020 for Muslim females when they have no children. **The term *house* seems to be associated with unmarried women, possibly indicating the expectation of domestic roles even for those without children.** In contrast, for both Hindu and Muslim males, the bias is considerably lower, with terms like

lonely for single Hindu males (TF-IDF value of 0.021) and *lonely* for Muslim males (TF-IDF value of 0.004).

- **Married:** In the Married category, the *house* term is also prevalent for both Hindu and Muslim females, with Hindu females having higher TF-IDF values (up to 0.037). **Muslim females with many children are moderately associated with *happy*, indicating happiness in a family size that meets societal expectations.** For Hindu and Muslim males, terms such as *happy* (TF-IDF value of 0.009 for Hindu males with no children) and *love* (TF-IDF value of 0.008 for Muslim males with no children) appear, indicating a generally lower bias compared to females.

- **Divorced:** For divorced individuals, Hindu females show higher bias in the term *house*, with TF-IDF values of 0.041, indicating a potential stereotype of divorced women still being associated with domestic responsibilities. Muslim females also show the term *house* with a TF-IDF value of 0.032 for those with one child, reflecting a similar bias. **For males, the bias is lower, with terms like *conflict* for Hindu males (TF-IDF value of 0.004) and *sad* for Muslim males (TF-IDF value of 0.004).**
- **Widowed:** The Widowed category for Hindu and Muslim females highlights terms, like *house* for Hindu and Muslim females. **For both genders, the bias remains relatively consistent, with females continuing to be associated with domestic roles, while males exhibit lower bias overall.**

G.3.3 Number of Children-Based Analysis

- **No Children:** For both Hindu and Muslim females, the *house* term is prominent, with TF-IDF values ranging from 0.008 to 0.037, reinforcing the **traditional association of women with the domestic sphere. The bias scores are lower for males**, with terms like *lonely* for Hindu males (TF-IDF value of 0.021) and *lonely* for Muslim males (TF-IDF value of 0.004), suggesting **emotional isolation as a stereotype for men without children.**
- **One Child:** In the One Child category, *house* is still the dominant term for Hindu and Muslim females, with highest TF-IDF values of 0.041 for Hindu females and 0.032 for Muslim females. **The bias scores are higher for males with frequent terms like *happy* and *love*.**
- **Many Children:** For individuals with many children, the term *house* continues to appear with high Bias TF-IDF values and high bias scores, especially for Hindu females (highest TF-IDF value of 0.046) and Muslim females (highest TF-IDF value of 0.036), **suggesting a stronger association of women with large families and domestic roles. For Hindu and Muslim males, the bias is lower, with terms like *happy* and *strong* emerging with lower TF-IDF values**, indicating that the association with emotional well-being or strength is more prevalent than domesticity.

G.3.4 Summary of Findings

- **Top Bias Terms:** The most frequently mentioned bias terms across all identities include *house*, *lonely*, and *happy*. These terms reflect the societal expectations tied to gender roles, with women often associated with domesticity (e.g., *house*) and emotional isolation (e.g., *lonely*) for men, especially when they are single. The highest Bias TF-IDF values are found in Hindu and Muslim females with children, particularly in the Married and Widowed categories.
- **Gender and Religion:** Female identities (Hindu and Muslim) show a consistent association with domestic roles (e.g., *house*) and emotional isolation, while male identities generally have lower bias scores. Hindu females tend to exhibit stronger biases, particularly in terms of domesticity, compared to their Muslim counterparts.
- **Marital Status:** The Married and Widowed categories show the highest bias scores, particularly for females. In contrast, single males tend to have higher bias related to emotional isolation (*lonely*). Divorced individuals show varied biases, with females being more strongly associated with domesticity.
- **Children:** The presence of children increases the bias for females, particularly in terms of domestic roles. However, males show less bias based on the number of children, with terms like *happy* emerging more frequently for married individuals, supporting the expectation that married individuals are happier than those with other marital statuses.

G.4 Top Bias Terms for Hindi - Hobbies and Values

To analyze the highest bias terms from our bias lexicon in Hindi generations of hobbies and values from the original prompting method, we highlight all 48 identities and associated bias scores in Table 8. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.4.1 Analysis of Gender and Religion

- **Hindu Female:** Terms like *housewife* and *household* dominate the Married, Divorced, and Widowed categories, with Bias TF-IDF values ranging from 0.033 to 0.139. This points to societal expectations of Hindu women as primarily responsible for domestic roles, particularly when they are married or have children. The bias scores for Hindu females show significant variation, with values from 0.100 to 0.294, **suggesting a higher degree of bias for those who are married with children.**
- **Hindu Male:** The highest bias terms for Hindu males include *object*, *independent*, and *protect*. These terms reflect societal expectations of men as independent, objective, and protective figures. The bias scores for Hindu males are generally low, ranging from 0.000 to 0.057, **indicating minimal societal bias compared to females. The absence of strong bias terms for Hindu males in categories like Single and Married suggests a more neutral societal perception of their roles, with the focus on independence and protection.**
- **Muslim Female:** For Muslim females, the terms *care* and *chore* are the most frequent. These terms reflect the societal expectation that Muslim women are responsible for domestic care and chores. The bias scores for Muslim females are relatively high, ranging from 0.045 to 0.211, with a notable increase when there are many children. **This suggests a higher bias towards traditional roles for Muslim women, especially those with children, where the expectation of domestic responsibility is more pronounced.**
- **Muslim Male:** The most prominent bias terms for Muslim males are *independent* and *honest*. These terms reflect the stereotype of Muslim men as assertive, independent, and responsible. **Their bias scores are lower compared to Muslim females, with values ranging from 0.006 to 0.090, indicating a less pronounced bias.** This suggests that societal expectations for Muslim males are relatively neutral, with a focus on honesty and independence. **However, there are less prominent**

bias terms such as *fight* and *battle*, furthering the stereotype that Muslims or males are violent.

G.4.2 Marital Status-Based Analysis

- **Single:** For both Hindu and Muslim females, the term *respect* and *care* are dominant. This indicates the **societal expectation that single women should receive or give respect and engage in caregiving roles, particularly when they have no children.** For Hindu and Muslim males, the bias is minimal, with terms like *N/A* and *independent* appearing. **The bias scores for males in the single category are quite low, ranging from 0.000 to 0.044.**
- **Married:** For Hindu and Muslim females, the *housewife* and *care* terms appear with **higher TF-IDF values in the Married category.** Hindu females, especially those with children, exhibit higher bias scores, with terms like *housewife* and *care*. Muslim females show similar trends, with *respect* and *care* appearing across all categories, and bias scores rising when children are present (up to 0.211 for those with many children). **For Hindu and Muslim males, terms like *protect*, *honest*, and *love* reflect societal expectations of men to care for and protect their families.** The bias scores for males in the Married category are relatively low, suggesting less bias compared to females.
- **Divorced:** For both Hindu and Muslim females, the terms *household* and *care* are prominent in the Divorced category. **This highlights the expectation that divorced women should take on domestic roles despite the change in their marital status.** For males, the bias is minimal, with terms like *positive* and *battle* appearing, **reflecting men being optimistic yet encountering challenges.**
- **Widowed:** The widowed category for both Hindu and Muslim females show terms like *household* and *care* with relatively high bias values. **This reflects the societal expectation for widowed women to continue with domestic duties and caregiving.** The bias scores for Hindu and Muslim females in the Widowed category are significant, ranging

Table 8: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Hobbies and Values** in Hindi outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.146	respect	0.032
		One child	0.137	care	0.033
		Many children	0.115	care	0.032
	Married	No children	0.100	domestic	0.017
		One child	0.203	housewife	0.033
		Many children	0.294	housewife	0.139
	Divorced	No children	0.166	household	0.063
		One child	0.151	household	0.059
		Many children	0.209	household	0.066
	Widowed	No children	0.184	household	0.054
		One child	0.100	household	0.053
		Many children	0.110	household	0.034
Hindu Male	Single	No children	0.000	N/A	N/A
		One child	0.017	object	0.017
		Many children	0.021	independent	0.021
	Married	No children	0.014	love	0.014
		One child	0.057	protect	0.013
		Many children	0.044	happy	0.017
	Divorced	No children	0.013	positive	0.013
		One child	0.000	N/A	N/A
		Many children	0.050	fight	0.028
	Widowed	No children	0.000	N/A	N/A
		One child	0.010	responsibility	0.010
		Many children	0.009	positive	0.009
Muslim Female	Single	No children	0.102	care	0.015
		One child	0.109	chore	0.022
		Many children	0.132	care	0.027
	Married	No children	0.140	respect	0.024
		One child	0.148	respect	0.024
		Many children	0.211	care	0.050
	Divorced	No children	0.140	chore	0.030
		One child	0.105	chore	0.017
		Many children	0.110	care	0.029
	Widowed	No children	0.045	household	0.012
		One child	0.075	care	0.013
		Many children	0.109	care	0.025
Muslim Male	Single	No children	0.044	independent	0.023
		One child	0.017	assertive	0.009
		Many children	0.006	positive	0.006
	Married	No children	0.073	honest	0.030
		One child	0.075	honest	0.015
		Many children	0.090	honest	0.030
	Divorced	No children	0.047	battle	0.024
		One child	0.028	fight	0.020
		Many children	0.037	fight	0.020
	Widowed	No children	0.012	ability	0.012
		One child	0.007	positive	0.007
		Many children	0.000	N/A	N/A

from 0.100 to 0.184. For males, the bias remains low, with terms like *positive* and *ability* showing minimal bias.

G.4.3 Number of Children-Based Analysis

- **No children:** For Hindu and Muslim females without children, terms like *respect* and *care* dominate, reflecting expectations of women to maintain dignity and engage in nurturing roles. The bias scores are moderate to high, ranging from 0.1 to 0.184 for Hindu females, and 0.045 to 0.140 for Muslim females. **This suggests that societal expectations are biased against women without children.**
- **One child:** With one child, Hindu and Muslim females are associated with terms like

care, *respect*, and *household*, with Bias TF-IDF values ranging from 0.013 to 0.059. **This suggests an increasing societal expectation for women with children to engage in domestic and caregiving roles. The bias scores for Hindu and Muslim males are quite low in this category, with terms like *protect* and *honest* appearing.**

- **Many children:** For Hindu and Muslim females with many children, terms like *care* and *household* are most prominent, with Bias TF-IDF values ranging from 0.025 to 0.139. These terms indicate a strong societal bias linking women with larger families to caregiving and household roles. **The bias scores for both Hindu and Muslim females are rel-**

atively high, ranging from 0.100 to 0.294, reflecting the pressure to fulfill traditional domestic roles. In contrast, the bias scores for males in this category remain low, suggesting less societal bias associated with the number of children.

G.4.4 Summary of Findings

- **Hindu Females** exhibit the highest bias across all categories, particularly in the Married, Divorced, and Widowed categories with terms like *housewife*, *household*, and *care*, reflecting strong societal expectations of domesticity and caregiving roles.
- **Hindu Males** show lower bias across all categories, with terms like *independent* and *protect*, suggesting a more neutral societal perception with an emphasis on independence and responsibility.
- **Muslim Females** display a similar pattern to Hindu females but with slightly lower bias scores. Key terms like *care* and *chore* appear frequently, suggesting traditional domestic expectations, especially for those with children.
- **Muslim Males** exhibit minimal bias, with terms like *independent* and *honest* appearing across categories, reflecting a more neutral or positive societal perception.
- **Marital Status** influences bias significantly, especially for women, with terms like *housewife* and *care* appearing most frequently for married, divorced, and widowed women.
- **Children Count** further amplifies bias for women, with terms like *care* and *household* being more frequent for women with children, particularly those with many children.

G.5 Top Bias Terms for Hindi - To-do List

To analyze the highest bias terms from our bias lexicon in Hindi generations of daily to-do lists from the original prompting method, we highlight all 48 identities and associated bias scores in Table 9. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.5.1 Analysis of Gender and Religion

- **Hindu Female:** The highest Bias TF-IDF terms for Hindu females include *clean* with high bias scores (up to 0.844 in the married with no children category). This term is repeated across all marital statuses, reflecting a **strong bias towards the expectation of cleanliness associated with women, regardless of marital status or number of children.** *Housewife* and *household* appear in the Married and Divorced statuses, with Bias TF-IDF values of 0.172 and 0.168, respectively, indicating a tendency to link Hindu women with traditional household roles. **The bias score for Hindu females ranges from 0.580 to 0.844, suggesting a notable bias, especially for those who are married or widowed with no children.**
- **Hindu Male:** For Hindu males, *responsibility* dominates across all marital statuses, with TF-IDF values showing a consistent bias of 0.0 to 0.032. This reflects the expectation that men, regardless of their marital status or number of children, are associated with responsibility. **The bias scores for Hindu males are significantly lower than for females, particularly for divorced males (ranging from 0.0 to 0.028),** showing less bias compared to their female counterparts.
- **Muslim Female:** For Muslim females, *clean* and *chore* appear frequently, with TF-IDF values of 0.064 to 0.125, indicating a bias towards associating Muslim women with cleanliness and domestic chores. **The bias scores for Muslim females range from 0.349 to 0.523, which are lower than Hindu females but still suggest a bias towards traditional roles.** *Clean* is a repeated term in all marital statuses, further reinforcing societal expectations tied to women.
- **Muslim Male:** Muslim males are primarily associated with the term *offer*, with a TF-IDF bias of 0.025 to 0.084. This **reflects the stereotype of men as providers. Their bias scores are much lower than those of Muslim females,** ranging from 0.045 to 0.115, similar to Hindu males, indicating minimal bias in comparison.

Table 9: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **To-do List** in Hindi outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.785	clean	0.152
		One child	0.750	clean	0.173
		Many children	0.580	house	0.113
	Married	No children	0.844	clean	0.193
		One child	0.708	clean	0.136
		Many children	0.822	housewife	0.172
	Divorced	No children	0.592	household	0.168
		One child	0.678	clean	0.152
		Many children	0.609	clean	0.133
	Widowed	No children	0.776	clean	0.194
		One child	0.600	clean	0.155
		Many children	0.730	clean	0.161
Hindu Male	Single	No children	0.042	responsibility	0.025
		One child	0.009	responsibility	0.009
		Many children	0.027	responsibility	0.016

G.5.2 Marital Status-Based Analysis

- **Single:** For both Hindu and Muslim females, the *clean* term is most prominent, with high Bias TF-IDF values of 0.173 for Hindu females and 0.125 for Muslim females. **This highlights the societal expectation for unmarried women to maintain cleanliness.** For Hindu and Muslim males, the bias is significantly lower. **The terms like *responsibility* and *offer* reflect expectations that men, even when single, are expected to be responsible or providers, though these biases are relatively weak (TF-IDF values around 0.025 to 0.057).**
- **Married:** For married Hindu females, *clean* and *housewife* dominate, **reflecting tradi-**

tional views that women should maintain domestic roles and cleanliness (TF-IDF values of 0.136 and 0.193). Married Muslim females show similar trends with *clean* appearing consistently (TF-IDF values around 0.064 to 0.108), indicating a cultural bias towards cleanliness in domestic settings. **Married males, regardless of religion, show a bias towards *responsibility*, with Hindu males showing a low value of 0.018 to 0.028 and Muslim males slightly higher at 0.036 to 0.047.**

- **Divorced:** Divorced Hindu females are associated with terms like *household* and *clean*, showing a persistent link to domestic roles, with high Bias TF-IDF values (TF-IDF val-

ues around 0.133 to 0.168). **Divorced Muslim females also show a strong association with *clean*, though with a slightly lower bias score than their Hindu counterparts** (TF-IDF values ranging from 0.084 to 0.099). For divorced males, both Hindu and Muslim, the terms show a significantly lower bias, focusing on *responsibility*, *management*, and *offer* (TF-IDF values from 0.014 to 0.043). **However, the expectations to provide for Muslim males is higher than the expectation for Hindu males to manage responsibilities, as seen by the higher Bias TF-IDF values.**

- **Widowed:** Widowed Hindu females, like their married counterparts, show a strong association with *clean*, reinforcing the stereotype of widowed women maintaining a traditional role in the home (TF-IDF values from 0.155 to 0.194). **Widowed Muslim females also show similar patterns, with *clean* remaining the most prominent term (with lower TF-IDF values around 0.099 to 0.109), reflecting expectations tied to cleanliness and domestic duties.** Widowed Hindu and Muslim males are associated with *offer* and *responsibility*. **Similar to divorced males, the expectations to provide for Muslim males is higher than the expectation for Hindu males to manage responsibilities, as seen by the higher Bias TF-IDF values.**

G.5.3 Number of Children-Based Analysis

- **No Children:** Hindu and Muslim females with no children show high bias values for *clean*, indicating **societal expectations for unmarried and childless women to adhere to cleanliness. For males, regardless of religion, the bias is much weaker**, with the term *responsibility* appearing in both Hindu and Muslim males, but with much lower TF-IDF values.
- **One Child:** The bias remains relatively strong for Hindu and Muslim females with one child, with ***clean* continuing to be a frequently mentioned term. Hindu males with one child show slightly more variation in bias terms, with *happiness* emerging** as a key term (TF-IDF value of 0.026).
- **Many Children:** For females with many children, both Hindu and Muslim females show

continued association with terms like *clean* and *housewife*, **maintaining strong societal biases regarding domesticity and caretaker roles** (TF-IDF values ranging from 0.085 to 0.172). Males, particularly **Hindu males, still show the bias towards *responsibility*** (TF-IDF values of 0.016 to 0.032).

G.5.4 Summary of Findings

- **Gender Bias:** There is a clear gender bias with females, particularly Hindu and Muslim females, receiving higher bias scores across all marital statuses and number of children categories. The terms associated with females are overwhelmingly related to domestic duties. Males, both Hindu and Muslim, generally show lower bias scores with terms like *responsibility* appearing across different marital and child count categories, but with much weaker associations.
- **Religious Influence:** Hindu females experience stronger bias compared to Muslim females, especially in terms like *clean* and *housewife*, which are repeated with higher TF-IDF values. Muslim males exhibit very low bias, with *offer* and *responsibility* as the primary terms, indicating a more neutral societal expectation.
- **Marital Status and Children:** Marital status plays a significant role in shaping bias for both genders, with higher bias for married and widowed females, associated with domestic and caregiving roles. The number of children also impacts bias, with females with many children continuing to be associated with domestic roles, while males show minimal bias related to children.

G.6 Top Overall Terms for Hindi - Story

To analyze the most frequent terms from the applications and 48 identities Hindi generations of stories under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 10. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.6.1 Analysis of Gender and Religion

- **Hindu Female:** The most prominent terms for Hindu females include *work* (0.048–0.052), *house* (0.056–0.063), and *name* (0.043–0.072). **The term *admit* appears notably for those with widowed many children (0.089), which may suggest a narrative involving women depicted as agreeable, since *admit* is a synonym of agree. The frequent presence of *house* aligns with traditional gender roles associating women with domestic spaces.**
- **Hindu Male:** The most frequent term is *wife* (0.054–0.088), appearing across all marital statuses, including single men with children, reinforcing a strong emphasis on spousal relationships. **Other notable terms include *friend* (0.051) appearing for single males with no children, and *several* (0.057) appearing for single males with many children, suggesting broader social narratives for men compared to women. Hindu males display a strong association with *wife* (TF-IDF up to 0.088), whereas Muslim males have similar patterns but with slightly higher TF-IDF values for *wife* (up to 0.091), possibly suggesting stronger spousal-centric storytelling in Muslim male narratives.**
- **Muslim Female:** Hindu and Muslim women share common frequent terms like *house*, *work*, and *name*, indicating similar gendered narratives. **Similar to Hindu females, the terms *work* (0.041–0.059) and *house* (0.051–0.059) are frequently found. The term *mother* (0.066) is more common among those single with many children, emphasizing maternal identity in single Muslim female narratives.**
- **Muslim Male:** The term *wife* (0.055–0.091) appears frequently, similar to Hindu males. The term *two* is particularly prevalent among Muslim men across all categories (TF-IDF up to 0.087), which does not appear as frequently for Hindu men. **The term *two* appears often, potentially reflecting family size, numerical references, or a cultural emphasis on duality (e.g., two wives, two partners, two children).**

G.6.2 Marital Status-Based Analysis

- **Single:** Single Hindu females with no children frequently feature *two* (0.093), while single Muslim females with no children also have *two* (0.070), **potentially reflecting a common storytelling pattern about pairs, relationships, or decision-making for females.** Single men, especially Hindu males, have a focus on the term *wife* (0.054–0.065), **which may reflect societal expectations of dependence in marriage for single men.**
- **Married:** Married individuals, both Hindu and Muslim, display a strong association with the term *wife*. **The term *wife* has high TF-IDF values for Hindu males (up to 0.088), emphasizing the importance of the spousal role in narratives about marriage. For females, both Hindu and Muslim, the terms *house* and *name* (0.043–0.057) are frequent, reinforcing traditional gender roles and indications of personal identity.**
- **Divorced:** Divorced individuals, especially women, frequently feature terms like *work* and *house*, which reflect resilience and an association with domestic responsibilities. **Muslim men have a high association with *wife*, indicating narratives surrounding their experience as a divorcee.**
- **Widowed:** Widowed women, both Hindu and Muslim, often have *house* and *admit*, which may suggest **themes of domestic responsibility and agreeable nature for women. Muslim and Hindu males have high associations with *wife*, although the association is stronger for Muslim males, indicating that stories frequently mention the loss of a wife for widowed males.**

G.6.3 Children-Based Analysis

- **No Children:** Individuals without children, regardless of gender or religion, have more neutral or non-domestic terms, such as *two* and *friend*, especially among Hindu males and Muslim males. **The absence of children often shifts the focus away from domestic life and maternal identity, particularly for women.**
- **One Child:** Hindu and Muslim females with one child frequently have terms like *house*,

Table 10: Highest Overall TF-IDF terms and values for all identities under the application **Story** in Hindi outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	two	0.093
		One child	work	0.048
		Many children	admit	0.089
	Married	No children	house	0.059
		One child	name	0.043

		One child	work	0.041
		Many children	mother	0.066
	Married	No children	house	0.059
		One child	name	0.057
		Many children	work	0.059
	Divorced	No children	tell	0.045
		One child	name	0.047
		Many children	two	0.055
	Widowed	No children	work	0.049
		One child	admit	0.045
		Many children	house	0.051
Muslim Male	Single	No children	two	0.087
		One child	wife	0.055
		Many children	one	0.051
	Married	No children	two	0.078
		One child	tell	0.050
		Many children	two	0.075
	Divorced	No children	wife	0.085
		One child	wife	0.079
		Many children	marry	0.068
	Widowed	No children	wife	0.084
		One child	wife	0.091
		Many children	wife	0.063

admit, and *name*. These terms may suggest stories related to motherhood, an agreeable nature, domesticity, and personal reflection. For men, especially Hindu males, the term *wife* appears prominently across all marital statuses.

- **Many Children:** Women with many children frequently have *house*, *mother*, and *work*, reflecting maternal and domestic roles. Single Hindu females with many children also have *admit* (0.089), which may signal themes of agreeable nature in women.

G.6.4 Summary of Findings

- Gendered patterns emerge strongly, with women frequently associated with *house* and

work, while men are more frequently linked to *wife*. These terms reflect traditional gender roles with women often tied to domestic responsibilities and men to their spousal relationships.

- Hindu and Muslim men exhibit similar trends, but Muslim men display slightly stronger emphasis on spousal relationships and numerical references (*two*).
- Married and widowed women, especially those with children, frequently feature terms reinforcing domestic and maternal roles. Women without children are less associated with domestic terms, suggesting greater narrative flexibility.

- The presence of children influences term frequency, with stronger associations between motherhood and household-related terms for women, especially for those with many children.

G.7 Top Overall Terms for Hindi - Hobbies and Values

To analyze the most frequent terms from the applications and 48 identities Hindi generations of hobbies and values under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 11. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.7.1 Analysis of Gender and Religion

- **Hindu Female:** Hindu females with different marital statuses frequently exhibit terms associated with traditional gender roles, particularly *housewife* (TF-IDF values between 0.122 and 0.182), emphasizing domesticity. For those with children, the term *mother* (0.199) appears frequently, indicating **strong maternal connotations. The presence of the term *housewife* across all marital statuses points to societal expectations tied to domestic duties**, reinforcing stereotypes about women's roles in Hindu society.
- **Hindu Male:** Hindu males, irrespective of marital status, **tend to feature terms like *music* (TF-IDF = 0.108) and *service* (TF-IDF = 0.088), indicating a broader range of activities outside the domestic sphere**. However, the term *single* (TF-IDF = 0.309) appears predominantly for married men with one child, possibly indicating independence or descriptions of single children. Terms like *spiritual* and *religion* appear moderately across all marital statuses, **indicating spirituality and religiosity as a key descriptor**.
- **Muslim Female:** Muslim women share some terms with Hindu women. However, *woman* (TF-IDF values between 0.099 and 0.156) is a frequent term, reinforcing traditional female identities. The term *woman* is frequent across marital statuses, emphasizing gendered narratives of female identity. Similar to Hindu females, terms like *mother* (0.111 for married with one child) **suggest maternal roles, emphasizing the societal expectation for women to be caregivers**.
- **Muslim Male:** Muslim men show a focus on terms like *honesty* (0.115) and *man* (TF-IDF values between 0.084 to 0.160), highlighting masculine ideals. Terms like *Islam* (TF-IDF values between 0.090 to 0.206) also emerge, reflecting **religious identity as a key theme in male Muslim narratives**.

G.7.2 Marital Status-Based Analysis

- **Single: Hindu Males** often feature terms like *music* (0.108) and *spiritual* (0.074), suggesting that **single men are seen as independent, with a focus on personal hobbies or spiritual development. Muslim Males** present

Table 11: Highest Overall TF-IDF terms and values for all identities under the application **Hobbies and Values** in Hindi outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	housewife	0.124
		One child	housewife	0.125
		Many children	housewife	0.139
	Married	No children	housewife	0.122
		One child	mother	0.199
		Many children	housewife	0.193
	Divorced	No children	housewife	0.127
		One child	housewife	0.139
		Many children	housewife	0.152
	Widowed	No children	housewife	0.135
		One child	household	0.085
		Many children	housewife	0.182
Hindu Male	Single	No children	music	0.108
		One child	religion	0.066
		Many children	spiritual	0.074
	Married	No children	service	0.088
		One child	single	0.309
		Many children	religion	0.083
	Divorced	No children	religion	0.119
		One child	single	0.129
		Many children	spiritual	0.105
	Widowed	No children	spiritual	0.163
		One child	religion	0.100
		Many children	religion	0.092
Muslim Female	Single	No children	woman	0.109
		One child	woman	0.128
		Many children	woman	0.142
	Married	No children	woman	0.144
		One child	mother	0.111
		Many children	woman	0.150
	Divorced	No children	woman	0.143
		One child	woman	0.135
		Many children	woman	0.152
	Widowed	No children	woman	0.156
		One child	woman	0.099
		Many children	woman	0.138
Muslim Male	Single	No children	honesty	0.115
		One child	man	0.115
		Many children	man	0.142
	Married	No children	man	0.110
		One child	man	0.084
		Many children	man	0.160

		One child	Islam	0.090
		Many children	Islam	0.113
	Widowed	No children	Islam	0.206
		One child	father	0.086
		Many children	spiritual	0.127

man (TF-IDF values from 0.115 to 0.142) and *honesty* (0.115), reflecting a focus on masculine values and self-reliance. **Hindu and Muslim females are associated with *housewife* and *woman* respectively, suggesting a frequent association with gender identity and domestic gender roles.**

- **Married:** For **Hindu Males**, the term *single* (0.309) is emphasized for those with one child, as well as terms like *service* and *religion* with relatively low Overall TF-IDF values. This suggests the interests of married Hindu males with one child relate to their single child, and those with children relate to religiosity. For **Muslim Males**, there is a notable focus on

man, emphasizing gender identity and masculinity. **Hindu and Muslim females are highly associated with terms like *housewife*, *mother*, and *woman***, highlighting the expectation for women to maintain gender identity, femininity, and caregiving within their homes.

- **Widowed and Divorced:** **Hindu and Muslim Females** frequently feature *housewife*, pointing to traditional views of **women being tied to domesticity, regardless of their marital status**. **Hindu Males** also show a significant focus on terms related to domesticity such as *religion* and *spiritual*. Similarly, **Muslim males** heavily reflect terms like *spiritual* and *Islam*, indicating possible narratives of

personal growth or religious devotion post-divorce or widowhood in males.

G.7.3 Children-Based Analysis

- **No Children:** For both Hindu and Muslim Males, terms such as *music* and *honesty* appear more often, **suggesting the presence of individualistic pursuits for males. Whereas females are associated with *woman* and *housewife*, indicating a feminine role within the home even when children are absent.**
- **One Child: Hindu Males** show a focus on *religion* and *single*, possibly reflecting **a desire for spiritual grounding when raising children and a focus on single children. Muslim Females** display a notable focus on *mother* (0.111), **reinforcing the maternal role of women with one child.** Hindu females are also highly associated with *mother*, *household*, and *housewife*, demonstrating maternal and domestic roles. Widowed Muslim males are associated with *father*, indicating an emphasis on fatherhood as a single father. Overall, Muslim males are associated with *Islam* and *man*, showing religious and masculine roles.
- **Many Children:** For both **Hindu and Muslim Females**, the term *housewife* reappears frequently, indicating the **cultural association of women with child-rearing responsibilities.** Hindu males emphasize religion and spirituality, Similarly, **Muslim Males** exhibit an increased focus on religion, manhood, and spirituality, reflecting **the significance of faith in fathers for the upbringing of children.**

G.7.4 Summary of Findings

- **Gendered Roles:** Female identities, regardless of religion, are strongly associated with domestic roles such as *housewife* and *mother*, reinforcing traditional gender stereotypes. Male identities, on the other hand, show more diverse roles such as *music*, *service*, and *honesty*, reflecting societal expectations of independence, work, and leadership.
- **Religion and Gender Interactions:** Hindu and Muslim males show a similar pattern, but Muslim males have a slightly stronger emphasis on spousal relationships and religious

terms (*religion*, *Islam*), pointing to the intersection of marriage and religious duties in their narratives. Muslim females, like Hindu females, emphasize roles centered on *woman* and *mother*.

- **Marital Status Impact:** The status of being married, divorced, or widowed influences term frequency, with married individuals (particularly women) associating with terms related to domestic life, while single individuals, especially men, show a broader range of personal hobbies and traits.
- **Children's Influence:** The presence of children strongly affects term choice, with *housewife* and *mother* emerging as the dominant terms for women with children, and men showing a mix of spousal roles, religious values, and personal interests.

G.8 Top Overall Terms for Hindi - To-do List

To analyze the most frequent terms from the applications and 48 identities Hindi generations of daily activities under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 12. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.8.1 Analysis of Gender and Religion

- **Hindu Female:** Hindu females are predominantly associated with terms like *clean* (TF-IDF from 0.140 to 0.213) across all marital statuses. The presence of children has little impact on the dominant terms, with *clean* being consistent, reflecting a narrative of domesticity and household responsibilities. The term *household* (0.161) appears for divorced Hindu females with no children, suggesting a shift in focus towards personal space and responsibilities after divorce. This aligns with traditional roles of women managing the home. The term *work* does not feature prominently in Hindu female outputs, highlighting the stronger cultural association of women with domestic duties rather than public or professional work.
- **Hindu Male:** Hindu males, particularly married ones, are moderately associated with the term *work* (TF-IDF values from 0.117 to 0.149), which reflects their role as providers. The term *chore* (0.093 to 0.155) appears more prominently for Hindu males with one child, indicating that even though men are expected to provide, they are also expected to contribute domestically, albeit less frequently than women.
- **Muslim Female:** The dominant term for Muslim females is *Namaz* (0.125 to 0.252), which reflects the cultural and religious emphasis on prayer and piety. This suggests a strong cultural tie to religious duties, especially in Muslim female narratives. However, this association is not as strong as the religious association for Muslim males.
- **Muslim Male:** Muslim males are highly and primarily associated with the term *Namaz* (0.223 to 0.654), indicating the strong religious influence on their roles. The term *Namaz* being prominent for Muslim males could reflect a cultural emphasis on piety and male leadership in religious practices. The term is more prominent in married, divorced, and widowed categories, indicating high religious obligations for Muslim males that are no longer single.

G.8.2 Marital Status-Based Analysis

- **Single:** For Hindu females, the term *clean* features prominently, emphasizing the domestic role expected of women, even when single. Muslim females and males are associated with *Namaz*, with a higher association for those single without children, suggesting that having fewer family obligations allows more time to be designated for religious prayers. Hindu single men, on the other hand, are associated with terms like *work* and *chore*, indicating an emphasis on career and household responsibilities. This reflects societal expectations for men to be independent providers.
- **Married:** Married Hindu women are frequently associated with terms like *clean* and *household* (0.161), emphasizing their role in managing the home. Married men, particularly Hindu males, are associated with *work* and household responsibilities, underscoring the traditional expectation of men caring and providing for their home. The presence of children intensifies the focus on domestic terms for women (e.g., *clean*, *household*) and on work and chores for men. Muslim males and females are highly associated with *Namaz*, indicating a greater religious practice within marriage.
- **Divorced/Widowed:** Both divorced and widowed Hindu women have terms like *household* and *clean* reflecting traditional domestic roles. Widowed and divorced men also retain the emphasis on *work* but appear less associated with domestic terms like *household*, indicating a shift in responsibilities after divorce or widowhood. Hindu males with many children are commonly associated with *husband*, indicating daily activities related to previously being a husband. Muslim males and females are very associated with *Namaz*, indicating a dependence on prayer in times of spousal loss.

G.8.3 Children-Based Analysis

- **No Children:** Across both genders, the term *work* is prevalent among Hindu males, while Hindu females are associated with *clean* and *household*, highlighting the traditional expectation for women to focus on domestic roles and males to focus on providing. For

Table 12: Highest Overall TF-IDF terms and values for all identities under the application **To-do List** in Hindi outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	clean	0.157
		One child	clean	0.196
		Many children	clean	0.140
	Married	No children	clean	0.209
		One child	clean	0.178
		Many children	clean	0.202
	Divorced	No children	household	0.161
		One child	clean	0.187
		Many children	clean	0.183
	Widowed	No children	clean	0.208
		One child	clean	0.213
		Many children	clean	0.207
Hindu Male	Single	No children	work	0.120
		One child	chore	0.152
		Many children	household	0.137
	Married	No children	work	0.149
		One child	chore	0.155
		Many children	household	0.171
	Divorced	No children	work	0.117
		One child	chore	0.093
		Many children	husband	0.090
	Widowed	No children	work	0.118
		One child	household	0.109
		Many children	clean	0.131
Muslim Female	Single	No children	namaz	0.200
		One child	namaz	0.197
		Many children	namaz	0.125
	Married	No children	namaz	0.249
		One child	namaz	0.197
		Many children	namaz	0.166
	Divorced	No children	namaz	0.252
		One child	namaz	0.210
		Many children	namaz	0.169
	Widowed	No children	namaz	0.227
		One child	namaz	0.247
		Many children	namaz	0.157
Muslim Male	Single	No children	namaz	0.332
		One child	namaz	0.331
		Many children	namaz	0.274
	Married	No children	namaz	0.654
		One child	namaz	0.430
		Many children	namaz	0.316
	Divorced	No children	namaz	0.602
		One child	namaz	0.380
		Many children	namaz	0.223
	Widowed	No children	namaz	0.389
		One child	namaz	0.397
		Many children	namaz	0.457

Muslim females and males, *Namaz* appears prominently, showing a cultural emphasis on spirituality. There are higher associations with *Namaz* when there are no children, **suggesting there is ample priority given to prayer.**

- **One Child:** The gender expectations are usually more stringent on those with children, especially one child. The presence of a child sometimes increases the prominence of terms related to domestic chores for both genders. This may indicate **as family size begins to change, the daily priorities are more emphasized.** For Muslim females and males, the term *Namaz* remains prominent, reinforcing the connection between religion and parent-

hood.

- **Many Children:** Hindu men and women with many children frequently feature terms like *clean*, *household*, and *chore*, reflecting the strong cultural tie to parental and domestic roles. Hindu men with many children are associated with terms like *clean* and *chore*, indicating that **while Hindu men are expected to assist, their roles are still seen as secondary to women's roles in terms of domestic work.** Muslim males and females are consistently tied to religious obligations, regardless of the number of children.

G.8.4 Summary of Findings

- **Hinduism and Gender:** Gendered roles are evident across all identities, with Hindu women consistently associated with domestic terms like *clean* and *household*. Hindu men are more often linked to terms like *work* and *chore*. Hindu men are expected to contribute to domestic work, but on a much smaller scale than Hindu women. Hindu women, especially those with children, are expected to fulfill maternal and domestic roles, while men are predominantly seen as providers and heads of households.
- **Islam and Gender:** Muslim men and women share similar patterns, but Muslim men show a stronger religious emphasis with terms like *Namaz* having higher Overall TF-IDF values, reflecting their connection to piety and spiritual leadership.
- **Impact of Marital Status:** Marital status impacts the term or term frequencies used for both genders. Widowed and divorced individuals amplify the frequent terms found for single or married individuals.
- **Impact of Children:** Muslim males and females have higher association with *Namaz* when they are married with no children, indicating ample association with prayer in marriage when there are no children present. The presence of children further strengthens the association between Hindu women and domesticity, while Hindu men, even with children, retain a focus on work and chores.

G.8.5 Analysis of Gender and Religion

- **Hindu Female:** Hindu females are predominantly associated with terms like *clean* (TF-IDF from 0.140 to 0.213) across all marital statuses. The presence of children has little impact on the dominant terms, with ***clean* being consistent, reflecting a narrative of domesticity and household responsibilities**. The term *household* (0.161) appears for **divorced Hindu females with no children, suggesting a shift in focus towards personal space and responsibilities after divorce**. This aligns with traditional roles of women managing the home. The term *work* does not feature prominently in Hindu female outputs, highlighting the stronger cultural association of women

with domestic duties rather than public or professional work.

- **Hindu Male:** Hindu males, particularly married ones, are moderately associated with the term *work* (TF-IDF values from 0.117 to 0.149), which **reflects their role as providers**. The term *chore* (0.093 to 0.155) appears more prominently for Hindu males with one child, indicating that **even though men are expected to provide, they are also expected to contribute domestically**, albeit less frequently than women.
- **Muslim Female:** The dominant term for Muslim females is *Namaz* (0.125 to 0.252), which reflects the cultural and religious emphasis on prayer and piety. This **suggests a strong cultural tie to religious duties**, especially in Muslim female narratives. However, this association is **not as strong as the religious association for Muslim males**.
- **Muslim Male:** Muslim males are highly and primarily associated with the term *Namaz* (0.223 to 0.654), indicating the strong religious influence on their roles. The term *Namaz* being prominent for Muslim males could reflect a **cultural emphasis on piety and male leadership in religious practices**. The term is more prominent in married, divorced, and widowed, categories, indicating **high religious obligations for Muslim males that are no longer single**.

G.9 Top Bias Terms for Urdu - Story

To analyze the highest bias terms from our bias lexicon in Urdu story generations from the original prompting method, we highlight all 48 identities and associated bias scores in Table 13. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.9.1 Analysis of Gender and Religion

- **Hindu Female:** The highest Bias TF-IDF terms for Hindu females include *house* and *home*, contributing to high bias scores ranging from 0.031 to 0.085. These terms suggest a strong societal bias toward associating women, particularly those who are married, with domestic responsibilities. **For married Hindu women, the bias increases further**, with bias scores between 0.064 to 0.085, **reinforcing the notion of Hindu women as caregivers**. The bias scores for Hindu females indicate a higher degree of bias compared to their male counterparts, especially among married, divorced, and widowed individuals. The term *death* appears for widowed individuals with one child, suggesting narratives surround death of a partner as a key story component.
- **Hindu Male:** For single Hindu males, the term *hero* appears most frequently, **reflecting the societal stereotype of men being strong**, heroic, and independent figures. Married individuals with children are described as *happy*, **indicating fulfillment with marriage and children, with *wrong* indicating bias against married individuals with no children**. In widowed and divorced categories terms like *depression*, *fire*, *back*, **indicate destruction, sadness, and backwardness**. *Car* demonstrates the idea of vehicle maintenance expected of males. The bias scores for Hindu males are significantly lower than for Hindu females.
- **Muslim Female:** For Muslim females, *home* appears as the most prominent term, **reflecting similar gendered expectations for Muslim women to be associated with household duties**. The bias scores for Muslim females range from 0.030 to 0.074, indicating a moderate to high level of bias, particularly in the married status with children. The term *happy* appears more often for Muslim women in marital statuses, **reflecting the societal pressure for women to find fulfillment through family roles**. Similar to Hindu widowed women with one child, *death* appears more commonly in stories for this identity, indicating narratives surrounding a spousal death.
- **Muslim Male:** Muslim males show a bias

toward terms like *allow* and *force*, with TF-IDF values between 0.002 and 0.004. These terms reflect the stereotypical view of **Muslim men as authoritative figures who make decisions or are providers**. **Married individuals are often associated with *happy*, showing the fulfillment in meeting societal expectations of marriage**. Yet, **divorced individuals are associated with more violent or conflict related terms**. The bias scores for Muslim males are relatively low (ranging from 0.004 to 0.032), comparable to Hindu males, suggesting minimal gender-based bias compared to Muslim females.

G.9.2 Marital Status-Based Analysis

- **Single:** Single Hindu females show a bias toward the terms *house* and *home*. These values indicate societal **expectations for unmarried women to be tied to domestic roles**. In contrast, single Hindu males show little bias, with terms like *hero* appearing with very low TF-IDF values of 0.002, and single Muslim males have terms *force*. This suggests that **single males are seen as independent and decision-making figures**, with minimal societal bias attached to their identity.
- **Married:** The bias for married Hindu females increases significantly, with the term *home* dominating and reaching a Bias TF-IDF value of 0.030. Similarly, Muslim females are commonly associated with *home*. **This highlights the expectation for married women to take on domestic responsibilities**. For married Hindu and Muslim males, the term *happy* is the most common, indicating success in the perspective of society where the expectation is to marry and reproduce. The bias is noticeably higher for Hindu females in comparison to other identities.
- **Divorced:** For divorced Hindu and Muslim females, terms like *house* and *home* continue to appear. This reflects the persistent stereotype that **divorced women are still expected to fulfill domestic duties, despite their marital status**. For divorced Hindu and Muslim males, the terms *depression* and *fight* appear respectively, indicating **negative emotions and conflict associated with divorced men**.
- **Widowed:** Widowed Hindu and Muslim fe-

Table 13: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Story** in Urdu outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.056	house	0.014
		One child	0.042	house	0.012
		Many children	0.040	home	0.010
	Married	No children	0.085	home	0.030
		One child	0.075	house	0.015
		Many children	0.064	house	0.013
	Divorced	No children	0.031	home	0.010
		One child	0.070	house	0.033
		Many children	0.038	home	0.008
	Widowed	No children	0.046	house	0.015
		One child	0.046	death	0.013
		Many children	0.060	house	0.028
Hindu Male	Single	No children	0.003	hero	0.002
		One child	0.023	hero	0.007
		Many children	0.026	hero	0.005
	Married	No children	0.031	wrong	0.005
		One child	0.032	happy	0.016
		Many children	0.042	happy	0.016
	Divorced	No children	0.015	depression	0.006
		One child	0.024	fire	0.005
		Many children	0.007	back	0.003
	Widowed	No children	0.014	fire	0.003
		One child	0.019	innocent	0.004
		Many children	0.012	car	0.004
Muslim Female	Single	No children	0.030	home	0.011
		One child	0.046	home	0.015
		Many children	0.047	home	0.015
	Married	No children	0.074	home	0.025
		One child	0.059	happy	0.016
		Many children	0.063	house	0.012
	Divorced	No children	0.045	home	0.017
		One child	0.081	house	0.035
		Many children	0.030	home	0.011
	Widowed	No children	0.040	home	0.012
		One child	0.047	death	0.015
		Many children	0.066	home	0.025
Muslim Male	Single	No children	0.021	allow	0.004
		One child	0.019	market	0.005
		Many children	0.008	force	0.002
	Married	No children	0.021	happy	0.007
		One child	0.032	happy	0.020
		Many children	0.019	happy	0.006
	Divorced	No children	0.004	force	0.003
		One child	0.014	fight	0.006
		Many children	0.003	responsibility	0.002
	Widowed	No children	0.013	offer	0.004
		One child	0.007	offer	0.003
		Many children	0.005	force	0.003

males with many children show higher bias towards terms like *house*, reflecting societal expectations tied to **widowhood and domestic roles**. Widowed Hindu males, on the other hand, show minimal bias, with terms like *car* and *innocent*, reflecting expected **gender roles in vehicle maintenance and innocence of Hindu individuals**. Widowed Muslim males, show minimal bias with terms like *offer* and *force*, depicting **provider roles and assertiveness**.

G.9.3 Number of Children-Based Analysis

- **No Children:** For both Hindu and Muslim females, the terms *house* and *home* are prevalent, with higher bias scores for Hindu females (up to 0.085) compared to Muslim females (up to

0.074). This reflects the societal **expectation for women with no children to maintain domestic spaces**. For males, the bias is **considerably lower**, with terms like *hero* and *happy*, suggesting a more positive or neutral societal perception of men without children. However, **married Hindu men with no children are associated with *wrong***, implying the **unacceptable nature of being married without children due to societal expectations**.

- **One Child:** For both Hindu and Muslim females, the bias is relatively consistent, with terms like *house* and *home* appearing frequently. For Muslim women that are married with one child, the term *happy* is frequent,

showing satisfaction in marriage and motherhood. The Bias TF-IDF values are sometimes higher for those with one child, indicating stronger societal expectations for women to be domestic figures once they have children. **For males, the terms *hero* and *happy* continue to appear.**

- **Many Children:** Hindu females with many children exhibit high bias, with the term *home* and *house*. This further reinforces the societal stereotype that women, particularly those with children, are expected to be caretakers and manage the household. For both genders, males with many children show minimal bias, with terms like *responsibility* and *offer* appearing with low TF-IDF values, suggesting **more societal neutrality toward men with children.**

G.9.4 Summary of Findings

- **Gender Bias:** Female identities consistently show higher Bias TF-IDF values compared to their male counterparts. Hindu and Muslim females are predominantly associated with domestic terms such as *house*, *home*, and *happy*, which reinforces traditional gender roles. Hindu and Muslim males, however, show a more neutral or positive bias toward terms like *hero*, *responsibility*, and *allow*, which reflects expectations of them as strong, independent providers.
- **Marital Status Bias:** Married females, exhibit the highest levels of bias, with terms like *house* and *home* having the highest TF-IDF values. Widowed and divorced females are also subjected to societal biases, though the terms are less pronounced than for married women. Single females show lower bias, although still higher than that of single males. Widowed and divorced males experience minimal bias.
- **Children-Based Bias:** The terms *home* and *happy* dominate for women with children, while males show little bias regardless of their number of children, suggesting a lack of societal expectations for men to be caretakers. The absence of children in women's and some male's identities also carries bias.

G.10 Top Bias Terms for Urdu - Hobbies and Values

To analyze the highest bias terms from our bias lexicon in Urdu generations of hobbies and values from the original prompting method, we highlight all 48 identities and associated bias scores in Table 14. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

Table 14: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Hobbies and Values** in Urdu outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.104	victim	0.016
		One child	0.087	clean	0.014
		Many children	0.088	home	0.021
	Married	No children	0.161	issue	0.034
		One child	0.188	household	0.027
		Many children	0.214	chore	0.035
	Divorced	No children	0.090	domestic	0.019
		One child	0.075	home	0.013
		Many children	0.143	home	0.034
	Widowed	No children	0.068	chore	0.016
		One child	0.068	home	0.013
		Many children	0.095	house	0.021
Hindu Male	Single	No children	0.051	independent	0.013
		One child	0.031	hero	0.016
		Many children	0.017	object	0.009
	Married	No children	0.066	social	0.023
		One child	0.054	social	0.022
		Many children	0.064	good	0.015
	Divorced	No children	0.008	positive	0.008
		One child	0.014	positive	0.007
		Many children	0.045	fight	0.019
	Widowed	No children	0.000	N/A	N/A
		One child	0.005	hero	0.005
		Many children	0.010	direction	0.010
Muslim Female	Single	No children	0.053	respect	0.011
		One child	0.033	care	0.009
		Many children	0.094	clean	0.011
	Married	No children	0.151	respect	0.022
		One child	0.090	kind	0.018
		Many children	0.144	respect	0.036
	Divorced	No children	0.058	respect	0.015
		One child	0.047	home	0.011
		Many children	0.104	home	0.021
	Widowed	No children	0.090	care	0.022
		One child	0.063	home	0.011
		Many children	0.033	family	0.009
Muslim Male	Single	No children	0.042	independent	0.026
		One child	0.014	independent	0.009
		Many children	0.011	strong	0.006
	Married	No children	0.048	respect	0.016
		One child	0.054	happy	0.014
		Many children	0.045	happy	0.022
	Divorced	No children	0.007	engagement	0.007
		One child	0.005	engagement	0.005
		Many children	0.012	change	0.007
	Widowed	No children	0.000	N/A	N/A
		One child	0.033	obligation	0.007
		Many children	0.000	N/A	N/A

G.10.1 Analysis of Gender and Religion

- **Hindu Female:** The highest Bias TF-IDF terms for Hindu females include *victim* (0.016) for single status with no children, *issue* (0.034) for married women with no children, and *home* (0.034) for divorced status with many children. These terms highlight traditional gender expectations, with Hindu females being associated with household duties and seen as victims or problems when not able to marry nor have children. The bias scores for Hindu females are higher in the **Married category**, particularly for those with many children with a high bias score of 0.214, where the term *chore* (0.035) is dominant, suggesting a heightened expectation for

domestic responsibilities.

- **Hindu Male:** The highest TF-IDF terms for Hindu males, such as *independent*, *hero*, and *social*, reflect the stereotypical association of Hindu men with independence, heroism, and masculine attributes. **The bias score for Hindu males remains relatively low, especially for the divorced and widowed category**, indicating that hobbies and values for men are less biased compared to women. **There are no bias terms detected for widowed Hindu males with no children.**
- **Muslim Female:** For Muslim females, *respect* (TF-IDF values from 0.15 to 0.036), dominate the TF-IDF values and contribute

to identities with high bias scores. These terms along with terms like *home* and *clean* reflect **strong societal expectations of Muslim women in terms of respectability and cleanliness**. The bias scores for Muslim females are higher in the Married category, particularly for those with many children (0.144), indicating a **significant bias associated with their roles as mothers**.

- **Muslim Male:** For Muslim males, terms such as *independent* (TF-IDF values from 0.009 to 0.026), and *strong* (0.006) indicate a **bias towards the expectation of strength and independence**. The bias scores for Muslim males are generally lower than those for Muslim females, reflecting **less societal pressure and fewer gender-related stereotypes**. There are more identities with no bias terms detected than for Hindu males.

G.10.2 Marital Status-Based Analysis

- **Single:** For both Hindu and Muslim females, terms like *victim* and *clean*, and *respect* indicate that society views single women as victims of circumstance, with expectations around domesticity and respectfulness. Hindu and Muslim males, on the other hand, are associated with *independent* and *hero*, suggesting that society perceives single men as autonomous and strong. These terms reflect the expectation that **single men are seen positively, while single women face stereotypes of vulnerability and domesticity**.
- **Married:** The Married category for both Hindu and Muslim females show higher Bias TF-IDF values. Hindu females with many children have a bias score of 0.214 with *chore* (0.035) being a dominant term, while Muslim females with many children have a bias score of 0.144 with *respect* (0.036). This shows the strong societal **expectation for women to fulfill domestic and respectful roles in marriage, with a marked difference in bias based on religious identity**. Hindu and Muslim married males are associated with *happy* and *social*, suggesting fulfillment with marriage.
- **Widowed and Divorced:** Widowed and divorced women face moderate bias, with terms like *chore*, *house*, and *home* for both religions.

These terms indicate negative stereotypes and **societal pressure on divorced and widowed women, reflecting a tendency to associate them with domestic roles or dependency**. **Widowed and divorced males face little to no bias**.

G.10.3 Number of Children-Based Analysis

- **No Children:** For Hindu and Muslim females, **the terms such as *victim* and *issue* indicate societal expectations for women without children to be seen as lacking a traditional role**. For Hindu males, *independent* dominates, indicating positive expectations for men without children, while Muslim males are associated with terms like *independent* and *strong*, showing that there are **minimal negative assumptions regarding males without children**.
- **One Child:** Hindu and Muslim females with one child are associated with *clean*, *home*, and *household*, suggesting that society expects them to **maintain domestic roles even when they have a child**. The bias score for Muslim males is lower, with terms like *positive* (0.007 to 0.008) and *obligation* (0.007).
- **Many Children:** Hindu females with many children face strong domestic bias, with terms like *chore* and *home* dominating. Similarly, **married Muslim females with many children are associated with *respect* (0.036), indicating that motherhood is linked with respectability for Muslim women**. For Muslim males with many children, terms like *happy* and *good* suggest **positive associations with fatherhood, reflecting societal expectations of men as strong providers**.

G.10.4 Summary of Findings

- **Bias in Gender:** Females, regardless of religion, face stronger bias than males. Hindu females show the highest bias, especially in married and divorced statuses, with terms such as *victim* and *chore* being dominant. Muslim females also experience significant bias, especially in marital statuses involving children, with *clean* and *respect* being frequent terms.
- **Bias in Religion:** Hindu women face stronger bias than Muslim women, particularly in the

Married category. The terms *clean* and *respect* show up frequently for Muslim females. There are more Muslim male identities with no bias terms detected than Hindu male identities with no bias terms detected.

- **Bias in Marital Status:** Married individuals, particularly women, experience the highest bias. The bias is particularly strong for Hindu females with many children, with *chore* being the dominant term. Muslim and Hindu married males are associated with sociability and happiness. The bias is less pronounced for males that are divorced or widowed.
- **Bias in Number of Children:** Women with many children face stronger bias, with domestic and respectful terms like *chore*, *home*, and *respect* dominating the bias terms. Hindu women with no children are described with *issue* and *victim*, suggesting a deviation from societal expectations. Men, particularly Muslim males, have less bias associated with parenthood, reflecting societal expectations of men as strong and independent providers.

G.11 Top Bias Terms for Urdu - To-do List

To analyze the highest bias terms from our bias lexicon in Urdu generations of daily to-do lists from the original prompting method, we highlight all 48 identities and associated bias scores in Table 15. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.11.1 Analysis of Gender and Religion

- **Hindu Female: The highest Bias TF-IDF terms for Hindu females include *clean* with high bias scores (up to 0.493 in the Married category).** This term is repeated across all marital statuses, reflecting a strong bias towards the expectation of cleanliness associated with women, regardless of marital status or number of children. The term *clean* has a consistently high TF-IDF value of around 0.077 to 0.124 across different categories, emphasizing the societal stereotype of women, particularly Hindu females, being linked to domestic roles. Additionally, Hindu females, especially those married with no children, face a higher bias score compared to other identity combinations. **Widowed Hindu women experience less bias than other marital statuses.**
- **Hindu Male: Hindu males show a much lower bias score compared to their female counterparts.** The most prominent terms for Hindu males include *sustenance*, *repair*, and *responsibility*, which reflect societal expectations of men being the providers and responsible figures in society. These identities across different marital statuses have relatively lower bias scores (ranging from 0.000 to 0.045). This suggests a milder societal expectation for men to fulfill traditional roles compared to women.
- **Muslim Female: For Muslim females, the most prominent term is also *clean*, with bias scores ranging from 0.177 to 0.433 across different marital statuses.** The association of Muslim women with cleanliness and domestic duties appears generally weaker than for Hindu women. The TF-IDF values for *clean* are notable but slightly lower than those for Hindu women, indicating a somewhat lower but still significant bias. **The highest bias score is for married women with no children (0.433), indicating pressure to have children after marriage.** Muslim females show a higher bias score than Muslim males, supporting the notion that women face more societal scrutiny than men.
- **Muslim Male: Muslim males show minimal bias, with terms such as *offer* and *sustenance* appearing frequently with low to moderate**

Table 15: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **To-do List** in Urdu outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.434	clean	0.116
		One child	0.420	clean	0.115
		Many children	0.373	clean	0.104
	Married	No children	0.493	clean	0.124
		One child	0.483	clean	0.116
		Many children	0.359	clean	0.097
	Divorced	No children	0.384	clean	0.109
		One child	0.341	clean	0.102
		Many children	0.374	clean	0.107
	Widowed	No children	0.296	clean	0.077
		One child	0.332	clean	0.090
		Many children	0.325	clean	0.089

		One child	0.000	N/A	N/A
		Many children	0.030	management	0.008
	Widowed	No children	0.033	management	0.012
		One child	0.034	repair	0.014
		Many children	0.022	repair	0.013
Muslim Female	Single	No children	0.272	clean	0.061
		One child	0.227	clean	0.071
		Many children	0.295	clean	0.075
	Married	No children	0.433	clean	0.086
		One child	0.314	clean	0.087
		Many children	0.321	clean	0.088
	Divorced	No children	0.269	clean	0.063
		One child	0.283	clean	0.054
		Many children	0.336	clean	0.074
	Widowed	No children	0.261	clean	0.059
		One child	0.177	clean	0.045
		Many children	0.169	clean	0.032
Muslim Male	Single	No children	0.079	sustenance	0.021
		One child	0.029	offer	0.016
		Many children	0.022	offer	0.013
	Married	No children	0.065	obligation	0.012
		One child	0.068	offer	0.019
		Many children	0.055	social	0.013
	Divorced	No children	0.033	engagement	0.026
		One child	0.048	offer	0.022
		Many children	0.054	offer	0.023
	Widowed	No children	0.059	provide	0.020
		One child	0.014	sustenance	0.007
		Many children	0.038	offer	0.025

TF-IDF values. **Their bias scores are much lower than those of Muslim females, aligning with the general observation that men face fewer stereotypes compared to women. Yet, the bias scores are higher than most bias scores for Hindu males.**

G.11.2 Marital Status-Based Analysis

- **Single:** For both Hindu and Muslim females, the term *clean* appears most frequently. Hindu females, particularly single ones, display a bias score ranging from 0.373 to 0.434, with *clean* being a significant term. This highlights the stereotype that single women are still expected to adhere to traditional roles despite their marital status. Muslim females show a similar pattern, with bias scores ranging

from 0.227 to 0.295 and the *clean* term appearing consistently. This suggests a societal tendency to link unmarried women with cleanliness and domestic duties. This association is stronger for Hindu women than Muslim women. For Hindu males, the bias scores are low (between 0.000 to 0.018), whereas they are slightly higher for Muslim males (0.022 to 0.079). **This shows single Hindu men experience the least bias of the single identities in this application.**

- **Married:** Married women, both Hindu and Muslim, exhibit higher bias scores, especially those with no children, suggesting married women are expected to have children. For Hindu females, the highest bias

term remains *clean*, indicating a stronger **association with domestic roles as they transition into marriage**. Married Muslim females also show a similar pattern. This highlights the increased expectation to maintain cleanliness in the home after marriage. Hindu males and Muslim males have moderate bias scores in the married category. Although, **the bias scores are slightly higher for married Muslim males than married Hindu males**.

- **Divorced and Widowed:** Both divorced and widowed women experience less bias than married women. Hindu females showing a bias score of 0.384 for those with no children. In contrast, Muslim females show relatively lower bias scores. The *clean* term remains the most prominent across these categories, **reflecting the ongoing societal expectation for women to maintain cleanliness despite marital status**. Hindu males face no or minimal bias, associating them with terms like *management* and *repair*. Muslim males have moderate bias scores, associated most often with *offer*.

G.11.3 Number of Children-Based Analysis

- **No children:** For women, the absence of children correlates with higher bias scores, with *clean* being the most frequent term. Married Hindu females with no children show the highest bias score (0.493), with a TF-IDF of 0.124 for the term *clean*. Muslim females with no children also experience a noticeable bias, with bias scores up to 0.433 for those who are married. This indicates **women with no children display the highest bias scores**. However, males with no children show moderate to low bias scores.
- **One child:** The presence of one child lowers the bias slightly for both Hindu and Muslim females, but the *clean* term remains prevalent. The bias scores are small for Muslim males with one child (0.014 to 0.068), and even smaller for Hindu males with one child (0.000 to 0.035). **This suggests having a child decreases the textual bias than having no children for all identities**.
- **Many children:** There are moderate to high bias scores for Hindu and Muslim females with many children. **For Hindu and Muslim**

males, having more children typically increases the bias scores than for individuals with one child.

G.11.4 Summary of Findings

- **Hindu Females** exhibit the strongest bias across all dimensions, especially in the areas of marital status and number of children. The term *clean* emerges as the dominant bias term for them, highlighting a societal expectation for women to conform to traditional domestic roles. The bias scores for Hindu females range from 0.296 to 0.493, indicating a high level of societal stereotyping, particularly for married women with no children.
- **Muslim Females** face similar stereotypes, but with slightly lower bias scores than Hindu females. The highest bias score is similarly for married women with no children, and the top term consistently frequent is *clean*. Yet, Muslim females experience somewhat less severe bias than their Hindu counterparts.
- **Hindu and Muslim Males** show minimal bias, with lower bias scores (ranging from 0.000 to 0.079). The dominant terms for males are related to *sustenance*, *maintenance*, and *responsibility*, reflecting traditional expectations of men as providers. These terms appear consistently across all marital statuses and number of children categories. Hindu males generally have lower bias scores than Muslim males.
- **Marital and Childbearing Status** play a significant role in shaping bias. Married women, especially those without children, face the highest bias scores, which are indicative of societal expectations tied to traditional gender roles. Women with many children, while still experiencing bias, show slightly lower bias scores.

G.12 Top Overall Terms for Urdu - Story

To analyze the most frequent terms from the applications and 48 identities Urdu generations of stories under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 16. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.12.1 Analysis of Gender and Religion

- **Hindu Female:** For Hindu females, the most frequent terms include *woman* (0.056 to 0.087), *wife* (0.069 to 0.080), and *doctor* (0.064). **The term *woman* is notably frequent across all marital statuses, emphasizing gender roles linked to femininity.** Additionally, *doctor* appears more often for those single with many children (0.064), suggesting some association with a maternal, yet professional identity. The appearance of *wife* aligns with traditional expectations of women being linked to marriage and domesticity.
- **Hindu Male:** Hindu males have *wife* (0.072 to 0.104) and *doctor* (0.061 to 0.122) as key terms. There is a stronger connection to the term *wife*, especially for married and divorced individuals. The term *doctor*, commonly associated with professional identity, appears for males with children, aligning with **traditional notions of men as providers.**
- **Muslim Female:** Muslim females share common terms with Hindu females with like *woman* (0.063–0.077), *wife* (0.063–0.090), **showing consistent gendered narratives.** *Woman* is particularly common across all marital statuses. Interestingly, Muslim women with many children have a somewhat strong emphasis on the term *two* (0.071), which may reflect societal or cultural emphasis on family structure and duality.
- **Muslim Male:** For Muslim males, the term *wife* appears most frequently (0.061–0.139). However, **Muslim males, particularly those that are not single, show a strong connection to *wife*,** suggesting a more pronounced role for the spouse in their narratives. **Additionally, terms like *doctor* (0.087 to 0.129) and *marry* (0.080) reflect roles linked to professional and reproductive duties.**

G.12.2 Marital Status-Based Analysis

- **Single:** Single Hindu females often feature the term *woman* (up to 0.081), highlighting the role of women in society. **The term *woman* resonates strongly with single status, possibly reinforcing societal views of women as incomplete without marriage or children.** Single Muslim females exhibit similar patterns, with *woman* (up to 0.077) being the

most common term, reinforcing the cultural expectation of women in relation to family and marriage. Single Hindu and Muslim males, however, **show less focus on familial terms.** **The terms *man* and *doctor* are more common,** reinforcing societal expectations of independence and self-sufficiency for men.

- **Married:** All married identities have strong connections to the term *wife*, **emphasizing the traditional role of the spouse in family dynamics.** The association is the strongest for males, particularly Muslim males. Hindu females that are married with one child are associated with *name* (0.066), indicating narratives mentioning personal identity.
- **Divorced and Widowed:** Across all identities, *doctor* appears for single and divorced individuals, **indicating a high association with *doctor* and those that do not have spouses.** Hindu widowed women with one child have lower associations with the term *woman*. For divorced and widowed men, the term *wife* still appears frequently, indicating a continued societal focus on the marital relationship even after separation or loss. **Divorced males with no children have a strong association with *doctor*, indicating an expectation to succeed in their profession.**

G.12.3 Number of Children-Based Analysis

- **No Children:** For both men and women, the absence of children often correlates with terms such as *wife* and *woman*, **emphasizing marital roles but with less focus on familial responsibilities.**
- **One Child:** Women with one child have frequent terms like *wife* and *woman*, reinforcing their maternal roles while still maintaining a connection to domestic responsibilities. **The term *live* appears more frequently for divorced women, reflecting the emotional burden of navigating post-divorce life with a child.** On the other hand, **the term *wife* still prevails for men, showing a strong dependence on their spouse or absence of a spouse.**
- **Many Children:** Females with many children show frequent terms like *woman*, while males with many children are associated with terms

Table 16: Highest Overall TF-IDF terms and values for all identities under the application **Story** in Urdu outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	woman	0.081
		One child	woman	0.056
		Many children	doctor	0.064
	Married	No children	wife	0.080
		One child	name	0.066
		Many children	woman	0.066
	Divorced	No children	two	0.075
		One child	live	0.072
		Many children	woman	0.087
	Widowed	No children	wife	0.069
		One child	woman	0.062
		Many children	live	0.062
Hindu Male	Single	No children	man	0.076
		One child	man	0.054
		Many children	doctor	0.061
	Married	No children	wife	0.104
		One child	wife	0.072
		Many children	two	0.071
	Divorced	No children	doctor	0.122
		One child	wife	0.101
		Many children	man	0.076
	Widowed	No children	wife	0.091
		One child	wife	0.096
		Many children	live	0.075
Muslim Female	Single	No children	woman	0.077
		One child	woman	0.066
		Many children	woman	0.063
	Married	No children	wife	0.090
		One child	wife	0.063
		Many children	two	0.071
	Divorced	No children	wife	0.082
		One child	live	0.067
		Many children	woman	0.088
	Widowed	No children	woman	0.083
		One child	wife	0.072
		Many children	woman	0.080
Muslim Male	Single	No children	wife	0.061
		One child	wife	0.064
		Many children	doctor	0.087
	Married	No children	wife	0.139
		One child	man	0.088
		Many children	wife	0.074
	Divorced	No children	doctor	0.129
		One child	wife	0.102
		Many children	marry	0.080
	Widowed	No children	wife	0.104
		One child	wife	0.103
		Many children	live	0.077

like *live* and *doctor*. **This shows females are associated with their femininity and gender when they have many children, while men are associated with livelihood and professions.**

G.12.4 Summary of Findings

- Gendered patterns are evident, with women more frequently associated with terms like *woman*, *wife*, and *house*, indicating their alignment with traditional domestic and maternal roles.
- Hindu and Muslim males exhibit similar trends, though Muslim males tend to show a stronger association with *wife*, reflecting more

pronounced spousal roles within their narratives.

- The term *wife* appears consistently across all identities. The appearance of *wife* aligns with traditional expectations of women being linked to marriage and domesticity. For males, the appearance of *wife* across most marital statuses indicates narratives focusing on spousal relationships or the lack of spousal relationships.
- Divorced and single identities exhibit the term *doctor*, showing an association with an esteemed profession for those without a spouse.

G.13 Top Overall Terms for Urdu - Hobbies and Values

To analyze the most frequent terms from the applications and 48 identities Urdu generations of hobbies and values under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 17. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.13.1 Analysis of Gender and Religion

- **Hindu Female:** The most prominent terms for Hindu females include *worship* (TF-IDF value up to 0.099), *raise* (up to 0.072), and *girl* (up to 0.081). These terms reflect **traditional gender expectations of religious devotion, raising children, and feminine roles such as caring for daughters**. The term *worship* appears frequently across different categories, highlighting the importance of religious involvement in Hindu female narratives.
- **Hindu Male:** For Hindu males, the most frequent terms are *favorite* (up to 0.080), *different* (up to 0.097), and *music* (up to 0.085), *religious* (0.116) and *poetry* (0.112). **These terms emphasize more individualized and social identities for men, as well as artistic and religious hobbies for widowed males.**
- **Muslim Female:** For Muslim females, the terms *desire* (up to 0.107), *woman* (up to 0.099), and *favorite* (up to 0.112) are prevalent. The term *desire* reflects aspirations and personal goals, while *woman* underlines gender-specific identity. Terms like *favorite* emphasize personal preference and attachment to family or certain values. **In comparison to Hindu females, Muslim females tend to have slightly higher frequencies of terms like *desire*, which may indicate a stronger narrative focus on personal aspirations.** In contrast to frequent terms present for Hindu women, Muslim women lack terms surrounding religious worship.
- **Muslim Male:** The most frequent terms for Muslim males include *worship* (up to 0.117), *man* (up to 0.108), and *favorite* (up to 0.097). These terms reinforce the religious devotion and masculine identity, with a noticeable emphasis on *worship* and traditional roles of men as protectors and leaders in family settings. Both Hindu and Muslim males show a strong association with *favorite* and *different*. The repeated emphasis on *worship* across Muslim male identities suggests stronger religious identity in Muslim male narratives compared to all other identities. **In comparison to Hindu males, Muslim males lack terms suggesting creative or artistic hobbies. Muslim males are associated the strongest with *worship*.**

Table 17: Highest Overall TF-IDF terms and values for all identities under the application **Hobbies and Values** in Urdu outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	worship	0.099
		One child	interested	0.056
		Many children	raise	0.072
	Married	No children	desire	0.073
		One child	worship	0.073
		Many children	girl	0.081
	Divorced	No children	fashion	0.042
		One child	girl	0.046
		Many children	raise	0.067
	Widowed	No children	worship	0.079
		One child	favorite	0.072
		Many children	worship	0.082
Hindu Male	Single	No children	favorite	0.072
		One child	favorite	0.080
		Many children	music	0.085
	Married	No children	favorite	0.061
		One child	favorite	0.057
		Many children	different	0.097
	Divorced	No children	music	0.078
		One child	music	0.071
		Many children	different	0.095
	Widowed	No children	religious	0.116
		One child	music	0.080
		Many children	poetry	0.112
Muslim Female	Single	No children	desire	0.095
		One child	woman	0.099
		Many children	desire	0.086
	Married	No children	desire	0.107
		One child	favorite	0.093
		Many children	favorite	0.112
	Divorced	No children	desire	0.090
		One child	desire	0.094
		Many children	favorite	0.065
	Widowed	No children	teaching	0.066
		One child	woman	0.088
		Many children	favorite	0.078
Muslim Male	Single	No children	worship	0.097
		One child	man	0.098
		Many children	want	0.071
	Married	No children	worship	0.117
		One child	man	0.108
		Many children	different	0.088
	Divorced	No children	worship	0.105
		One child	favorite	0.097
		Many children	favorite	0.095
	Widowed	No children	worship	0.085
		One child	favorite	0.065
		Many children	favorite	0.080

G.13.2 Marital Status-Based Analysis

- **Single:** For single individuals, Hindu females show terms like *worship* and *raise*, suggesting a focus on family and religion. Muslim males also show the term *worship*, **suggesting a concentration in religious practice when single**. Whereas Muslim women are associated with *desire* and *woman*, and Hindu males are associated with *music* and *favorite*, **showing individualistic passions related to their identity**.
- **Married:** The term *worship* dominates for married Hindu females and Muslim males, suggesting high religious practice. **Muslim and Hindu males have the term *different*,**

suggesting diverse interests. Married Hindu females exhibit a mixture of *worship* and *girl*, which highlights their connection to familial responsibilities and child-rearing roles.

- **Divorced and Widowed:** Divorced and widowed women generally lean towards terms such as *fashion* and *teaching* when they have no children, reflecting **resilience and adaptation to new roles outside traditional family structures**. Hindu widowed males have a stronger emphasis on the term *music* than those that are divorced and also have a strong association with *religious* and *poetry*. This shows **Hindu divorced males have individualistic hobbies, which become more cre-**

ative and concentrated in comparison to widowed individuals. Muslim males have an increased term usage of *worship* when divorced (0.105) than when widowed (0.085), **suggesting religious dependence increases for divorced Muslim males than widowed Muslim males.**

G.13.3 Children-Based Analysis

- **No Children:** Individuals with no children, regardless of gender or religion, frequently feature terms like *worship*, *desire*, *favorite*. This suggests that **those without children may lean towards individual religious devotion or social preferences.** Most of the highest TF-IDF values occur for identities without children, **suggesting that the absence of children increases the association with various interests and hobbies.**
- **One Child:** The term *worship* continues to appear for Hindu females and Muslim males, reinforcing spiritual or religious connections in the context of child-rearing. For Muslim females and Hindu males, the term *favorite* is prevalent, indicating individualistic passions.
- **Many Children:** Those with many children, particularly Hindu and Muslim females, **frequently use terms like *raise*, *worship*, and *favorite* highlighting maternal and religious roles, as well as individualistic hobbies.** Muslim and Hindu males with many children demonstrate high prevalence of the term *different*, **indicating interests are more diverse for males as number of children increases.**

G.13.4 Summary of Findings

- **Gendered Patterns:** Hindu women were often associated with *worship*, *raise*, and *girl*, reinforcing traditional gender roles related to family, religion, and child-rearing. Muslim females have a stronger narrative focus on aspirations and personal goals rather than religious worship. Hindu males are associated with *music*, *favorite*, *religious*, and *poetry*, highlighting individualized identities, artistic expression, and religious engagement, especially for widowed males. Compared to Hindu males, Muslim males show less emphasis on creative hobbies but stronger associations with religious identity.

- **Marital Status:** Widowed and divorced women, however, lean more toward terms like *fashion* and *teaching*, which reflect adaptation to new roles outside traditional family structures. These terms suggest a shift towards professional, independent, or individual roles after the loss of a spouse or marital separation. Widowed Hindu males show stronger artistic interests than divorced Hindu males. Married Muslim males show the strongest association with religious practice as seen by high TF-IDF values for the term *worship*.
- **Number of Children:** High TF-IDF values for terms occur for those without children, indicating a broader range of interests and hobbies in the absence of parental responsibilities. Hindu and Muslim males with many children frequently associate with *different*, indicating that a larger family size correlates with greater diversity of interests.

G.14 Top Overall Terms for Urdu - To-do List

To analyze the most frequent terms from the applications and 48 identities Urdu generations of daily activities under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 18. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.14.1 Analysis of Gender and Religion

- **Hindu Female:** The most frequent term for Hindu females, regardless of marital status, is *clean* (TF-IDF between 0.099 and 0.157), signaling a strong connection to domesticity. This term appears consistently across all categories, including those with children, underscoring the stereotypical gender role of women in the household. Another notable term is *cooking* (TF-IDF = 0.135) for married women with many children, **highlighting the maternal role in the kitchen.**
- **Hindu Male:** The term *worship* (TF-IDF ranging from 0.104 to 0.264) is most prominent for Hindu males, regardless of marital status or children count. This term reflects the traditional association of men with religious and spiritual leadership. **The term *cooking* (0.084) appears for married men with many children, showing the societal expectation of men to also maintain domestic spaces.**
- **Muslim Female:** For Muslim females, *cooking* (0.095 to 0.194) appears frequently, especially for those with one child, where the TF-IDF value peaks. The term *Quran* (0.127) also appears for widowed Muslim females, **highlighting the intersection of motherhood, religion, and societal expectations of religious adherence.** Both Hindu and Muslim women have similar associations with terms related to household chores. However, **Muslim females show a stronger connection to religious terms like *Quran*, reflecting the cultural and religious expectations on women in Muslim communities.** Additionally, the TF-IDF values are higher for Muslim women than Hindu women, indicating stronger associations with *cooking* for Muslim women.
- **Muslim Male:** *Worship* (up to 0.197) is the most common term for Muslim males, which signifies the societal expectation of men to prioritize religious duties. **Terms such as *Quran* and *prayer* reinforce the religious identity of Muslim men.** Hindu males emphasize terms like *worship*, similar to Muslim men, although Muslim males have lower TF-IDF values for *worship*, reflecting a less pronounced religious focus in their identities.

G.14.2 Marital Status-Based Analysis

- **Single:** Single Hindu females show a notable emphasis on *clean*, while single Hindu males focus on *worship*. This reinforces the societal expectation of **single men as independent and religiously oriented, while women are associated with domesticity.** For Muslim singles, *worship* is dominant for males, and *cooking* for females, emphasizing gendered domestic roles.
- **Married:** Generations for married Hindu males and females both frequently use *cooking* when they have many children, signifying their shared domestic responsibilities. Married Muslim women show a higher frequency of *cooking* (up to 0.167), while Muslim males show frequent use of *clean* (0.093). **This shows there is distribution of household responsibilities among genders in both religions.** However, the emphasis on *cooking* for Muslim females is the strongest, **indicating Muslim women are more tied to domestic roles compared to other identities.**
- **Widowed and Divorced:** Widowed and divorced Hindu and Muslim females share a common pattern with terms like *clean* and *cooking*, signaling domestic roles. However, Muslim females who are widowed are associated increasingly with *Quran* more than cooking. Similarly, Widowed Muslim males are often associated with *Quran*. **This shows increased connection to the Quran for widowed Muslim women and men.** Similarly, Hindu males who are divorced and widowed focus on *worship*, yet the emphasis on *worship* increases for Widowed males. **Hindu males are increasingly associated with *worship* when divorced, whereas Hindu women do not show increased religious practice upon widowed status.** Divorced and widowed males have some domestic-oriented terms like *clean* and *cook*, showing males taking on expectations of women in times of spousal loss.

G.14.3 Number of Children-Based Analysis

- **No Children:** Women with no children show frequent use of terms related to cleanliness and domestic duties. However, **Hindu and Muslim males show high usage of the term**

Table 18: Highest Overall TF-IDF terms and values for all identities under the application **To-do List** in Urdu outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	clean	0.144
		One child	clean	0.141
		Many children	clean	0.133
	Married	No children	clean	0.157
		One child	clean	0.145
		Many children	cooking	0.135
	Divorced	No children	clean	0.137
		One child	clean	0.127
		Many children	clean	0.145
	Widowed	No children	clean	0.099
		One child	clean	0.122
		Many children	clean	0.118
Hindu Male	Single	No children	worship	0.188
		One child	worship	0.145
		Many children	worship	0.105
	Married	No children	worship	0.144
		One child	worship	0.104
		Many children	cooking	0.087
	Divorced	No children	worship	0.159
		One child	worship	0.124
		Many children	clean	0.084
	Widowed	No children	worship	0.264
		One child	worship	0.176
		Many children	worship	0.115
Muslim Female	Single	No children	cooking	0.141
		One child	cooking	0.194
		Many children	cooking	0.108
	Married	No children	cooking	0.127
		One child	cooking	0.167
		Many children	cooking	0.129
	Divorced	No children	daily	0.078
		One child	cooking	0.095
		Many children	cooking	0.141
	Widowed	No children	Quran	0.127
		One child	cooking	0.101
		Many children	Quran	0.151
Muslim Male	Single	No children	worship	0.197
		One child	pray	0.123
		Many children	Quran	0.121
	Married	No children	prayer	0.093
		One child	Quran	0.099
		Many children	clean	0.093
	Divorced	No children	worship	0.123
		One child	worship	0.115
		Many children	cooking	0.112
	Widowed	No children	Quran	0.151
		One child	Quran	0.145
		Many children	Quran	0.159

worship with TF-IDF values 0.188 and 0.197 respectively, for the single category.

- **One Child:** Hindu identities with single children do not show much variation in terms and term frequencies. **However, Muslim women have a stronger use of the term *cooking* when single and married.** On the other hand, single Muslim men with one child are frequently associated with *pray*.
- **Many Children:** Women with many children often emphasize domestic terms like *cooking* and *clean*, with a **slight variation toward religious terms like *Quran* for Muslim women.** Males with many children, especially when divorced, are also associated with *cooking* and

clean. This indicates divorced males with many children are expected to take on more domestic responsibility.

G.14.4 Summary of Findings

- **Gender and Religion:** Across all categories, women are strongly associated with domestic terms such as *clean* and *cooking*, reflecting traditional gender roles. Muslim women are more strongly associated with these terms than Hindu women. Men show a stronger emphasis on religious terms like *worship*. Muslim women and men are associated with Islamic practice, whereas more specific forms of worship are not mentioned for Hindu identities.

- **Marital Status:** Married women frequently feature terms like *clean* and *cooking*, highlighting traditional expectations of marital roles. Divorced and widowed men are increasingly associated with domestic work and religious practice than in other marital statuses.
- **Children:** The presence of children, especially many children, reinforces domestic and maternal roles for women. Domestic roles are sometimes present for divorced or widowed men, particularly when there are many children, indicating domestic responsibility in the absence of a spouse.

G.15 Top Bias Terms for Bengali - Story

To analyze the highest bias terms from our bias lexicon in Bengali story generations from the original prompting method, we highlight all 48 identities and associated bias scores in Table 19. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.15.1 Analysis of Gender and Religion

- **Hindu Female:** The highest Bias TF-IDF terms for Hindu females include *family* (up to 0.021) and *house* (0.014). **The bias score for Hindu females varies, with the highest being for Married women with no children (0.073), reinforcing societal expectations around childbearing.** Meanwhile, The term *suffer* (0.004) appears for Divorced Hindu females with no children, **indicating a negative association with separation.**
- **Hindu Male:** Hindu males have relatively lower bias scores compared to Hindu females, with terms such as *happy* (0.007) and *respect* (0.006) appearing in Married and Many Children statuses. The bias scores for Single Hindu males are among the lowest, **consistent with societal views that single men are less scrutinized than single women.**
- **Muslim Female:** Muslim females show higher bias scores in categories like Married with No Children (0.075) and Divorced with One Child (0.057). The term *home* (up to 0.017) appears frequently, reinforcing the stereotype of Muslim women being more confined to domestic spaces. The term *attack* (0.005) for divorced Muslim females suggests a more negative association with this identity, **aligning with biases against divorced women in traditional societies, and stereotypes of violent behavior in Muslims.**
- **Muslim Male:** The bias terms for Muslim males include *car* (up to 0.006), reflecting a stereotype of maintenance responsibilities. Muslim male bias scores are generally lower compared to Muslim females, suggesting **relatively neutral portrayals.** The term *manipulate* (0.005) appears for Widowed Muslim males with no children, **indicating some negative perception for widowed individuals.** Widowed males with many children have the lowest bias score (0.002).

G.15.2 Marital Status-Based Analysis

- **Single:** Hindu and Muslim single males have relatively low bias scores (0.000–0.017), supporting the notion that single men face fewer societal expectations. However, the bias scores are higher for Muslim males (up to 0.017) than Hindu males (up to 0.011). On the

Table 19: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Story** in Bengali outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.015	force	0.003
		One child	0.026	family	0.006
		Many children	0.011	family	0.003
	Married	No children	0.073	family	0.018
		One child	0.046	love	0.011
		Many children	0.056	family	0.018
	Divorced	No children	0.016	suffer	0.004
		One child	0.048	house	0.014
		Many children	0.015	home	0.004
	Widowed	No children	0.009	family	0.002
		One child	0.029	death	0.007
		Many children	0.050	family	0.021

		One child	0.006	allow	0.002
		Many children	0.002	car	0.002

other hand, single females, especially Hindu women, show a stronger association with *family*, suggesting expectations tied to their future roles. **Single Hindu women with no children are moderately associated with *force*, suggesting loss of control and dominance.**

- **Married:** Hindu and Muslim married females have some of the highest bias scores, especially those with no children, **reinforcing social pressure to have children.** The repeated presence of *family* and *home* highlights the expectation that married women prioritize domestic life. **Married men are associated often with *happy*, showing the expectation that marriage leads to happiness.**

- **Divorced:** The term *suffer*, *attack*, *bad*, *stress* appear across all identities in the divorced category. **This reflects negative biases associated with divorce for all identities.** Females have higher bias scores in the divorced category in comparison to males, with **higher bias scores for Muslim females than Hindu females.**

- **Widowed:** Widowed women, particularly those with many children, have high bias scores (up to 0.057). The term *death* often appears for Muslim and Hindu widows, **reinforcing the view of widowhood as a state of loss.** Muslim males with many children often show the frequent usage of *manipulate*, implying manipulative nature in these individuals.

However, **the bias scores are moderate to low for males, while moderate to high for females.**

G.15.3 Number of Children-Based Analysis

- **No Children:** The highest bias scores in this category are for married women, indicating the strong expectation that married individuals should have children. The term *family* appears prominently for women, emphasizing societal pressure to focus on family and family growth. Males have lower bias scores in comparison to females. Males are often associated with *car*. Divorced and widowed Muslim males with no children are associated with more controlling terms like *manipulate* and *authority*. Whereas Hindu males who are divorced with no children are often associated with *stress*. This indicates that these identities face negative biases related to their identity.
- **One Child:** Divorced and widowed individuals with one child sometimes show a slight increase in bias scores, **likely due to societal pity**. In terms of gender, **divorced women with one child show very high bias scores.**
- **Many Children:** Muslim single women with many children shows the frequent usage of *bad*, **reflecting that having multiple children before marriage is stigmatized, especially for Muslim women.** The term *family* is prominent for women in this category, **reinforcing the idea that having many children is associated with a strong familial identity.** The highest bias score in this group (0.057) belongs to **Widowed Muslim females, possibly indicating added social burdens or expectations.**

G.15.4 Summary of Findings

- Women, particularly Married and widowed ones, have higher bias scores than men, with terms such as *family*, *home*, and *suffer* appearing frequently.
- Muslim women tend to have higher bias scores than Hindu women, especially in categories like Married with No Children and Divorced.
- Single men have the lowest bias scores, aligning with societal perceptions that they are independent and face fewer expectations.

- The highest bias scores are found in married women with no children, indicating strong societal pressure around reproduction.
- Terms associated with widowhood for women, such as *death* and *family*, indicate societal narratives of loss and dependency. Divorced men are sometimes associated with terms like *stress* and *bad*, demonstrating a similar societal narrative.

G.16 Top Bias Terms for Bengali - Hobbies and Values

To analyze the highest bias terms from our bias lexicon in Bengali generations of hobbies and values from the original prompting method, we highlight all 48 identities and associated bias scores in Table 20. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.16.1 Analysis of Gender and Religion

- **Hindu Female:** The most frequently appearing bias term for Hindu females are *kind* and *family*, appearing across all marital statuses and children counts. The highest bias score (0.169) is observed for Married Hindu Females with One Child, where the term *kind* holds a TF-IDF of 0.068. These terms suggest that **Hindu females are frequently associated with positive social roles emphasizing emotional labor and care**. The overall bias score for Hindu females ranges from 0.020 (widowed with no children) to 0.169 (married with one child), with **bias scores being generally higher for married individuals**.
- **Hindu Male:** Hindu males exhibit significantly lower bias scores compared to Hindu females, with some categories registering a bias score of 0.000 (single with no children and widowed with many children). The most common bias terms include *social* and *kind* in the married categories, **suggesting an association with social engagement for married individuals** rather than caregiving roles. Another moderate bias score is observed for those **divorced with one child, with the most frequent term *sorrow*, suggesting these individuals typically experience sorrow**. The highest bias score (0.043) is observed for married Hindu males with one child, where the term *kind* holds a TF-IDF of 0.020. Unlike Hindu females, Hindu males do not exhibit strong bias associations with familial roles.
- **Muslim Female:** Similar to Hindu females, Muslim females show high bias scores, particularly in married and child-rearing categories. The most frequently occurring bias term is *kind*, appearing across all categories, with the highest TF-IDF (0.137) for married Muslim females with one child. **This indicates women are expected to be *kind***. The highest bias score (0.209) is observed for married Muslim females with one child, which is also the highest recorded bias score across all identities. The term *dignity* appears uniquely for married Muslim females with no children, with a TF-IDF of 0.021, reflecting **potential societal expectations regarding honor when women do not have children**. Furthermore, the term *dress* appears for widowed Muslim

females with no children, **showing an emphasis on clothing unique to Muslim women**.

- **Muslim Male:** Muslim males exhibit relatively lower bias scores compared to their female counterparts. The highest bias score (0.048) is observed for married Muslim males with one child, where the term *kind* appears with a TF-IDF of 0.035. The terms *independent* and *leader* suggest an association with autonomy and authority. Like Hindu males, **Muslim males show lower bias associations compared to females, with some categories recording a bias score of 0.000**. Divorced and widowed individuals show moderate bias scores with terms like *sorrow*, *strict*, and *traditional*, **depicting Muslim males as rigid and sorrowful in the absence of a spouse**.

G.16.2 Marital Status-Based Analysis

- **Single:** Hindu and Muslim single males show the lowest bias scores, with some bias scores as low as 0.000. **Hindu and Muslim single females have significantly higher bias scores, with *kind* being the dominant term across all child categories**. The highest bias score (0.100) is for single Muslim females with many children.
- **Married:** Married individuals, particularly females, have the highest bias scores in the dataset. Married Muslim females with one child have the highest recorded bias score (0.209), with *kind* appearing frequently. **This implies women are expected to be *kind*, and this expectation is stronger for Muslim women than for Hindu women**. Terms such as *love* (Hindu married females) and *dignity* (Muslim married females) reinforce societal expectations of women in traditional marriage roles. Muslim and Hindu males are associated with *social* and *kind*, **implying married men are seen as empathetic and sociable**.
- **Divorced:** Divorced individuals show moderate bias scores, with female bias scores being higher than male. Hindu and Muslim Divorced Females are associated with *family* and *kind*, reflecting an expectation of caregiving responsibilities post-divorce. **Divorced Hindu and Muslim males are associated with *sorrow*, showing negative emotions with for divorced males**.

Table 20: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Hobbies and Values** in Bengali outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.072	kind	0.032
		One child	0.058	kind	0.046
		Many children	0.083	kind	0.047

		Many children	0.007	freedom	0.007
	Married	No children	0.036	social	0.012
		One child	0.043	kind	0.020
		Many children	0.021	social	0.013
	Divorced	No children	0.008	confidence	0.008
		One child	0.014	sorrow	0.014
		Many children	0.007	strong	0.007
	Widowed	No children	0.008	confidence	0.008
		One child	0.005	offer	0.005
		Many children	0.000	N/A	N/A
Muslim Female	Single	No children	0.056	kind	0.022
		One child	0.083	kind	0.061
		Many children	0.100	kind	0.054
	Married	No children	0.064	dignity	0.021
		One child	0.209	kind	0.137
		Many children	0.077	kind	0.060
	Divorced	No children	0.024	kind	0.011
		One child	0.056	kind	0.032
		Many children	0.030	kind	0.018
	Widowed	No children	0.037	dress	0.010
		One child	0.028	kind	0.024
		Many children	0.037	kind	0.021
Muslim Male	Single	No children	0.037	independent	0.025
		One child	0.006	freedom	0.006
		Many children	0.000	N/A	N/A
	Married	No children	0.025	kind	0.014
		One child	0.048	kind	0.035
		Many children	0.034	kind	0.014
	Divorced	No children	0.013	leader	0.007
		One child	0.012	sorrow	0.012
		Many children	0.008	strict	0.008
	Widowed	No children	0.012	traditional	0.006
		One child	0.005	allow	0.005
		Many children	0.007	strong	0.007

- **Widowed:** Widowed females, particularly Hindu and Muslim, have moderate bias scores, with terms like *kind* and *family* frequently appearing. For Muslim females the term *dress* uniquely appears for those without children, suggesting increased scrutiny based on clothing. **Muslim males frequently are tied to control and tradition through terms like *traditional* and *allow*.**

G.16.3 Number of Children-Based Analysis

- **No Children:** Individuals with no children generally have lower bias scores than those with children. The highest bias score (0.090) is for Hindu married females with no children, where *love* (TF-IDF 0.036) is the dominant term. Muslim women that are married with

no children often are associated with *dignity*, **implying that marriage for Muslim women without children places a women's dignity under examination by society.**

- **One Child:** One-child categories show the highest bias scores across multiple identities. The highest bias score (0.209) is for married Muslim females with one Child, where *kind* (TF-IDF 0.137) is the dominant term. Divorced Muslim and Hindu males with one child are associated with *sorrow*, **possibly implying loneliness and negative emotions for single fathers after divorce.**
- **Many Children:** Bias scores vary, with some identities showing increased bias while others

decrease. The highest bias score (0.135) is for Hindu married females with many Children, associated with *kind* (TF-IDF 0.036). **This shows women with many children are expected to be nice.** Hindu and Muslim males with many children have bias scores as low as 0.000 with the highest scores still at moderate levels in comparison to other bias scores.

G.16.4 Summary of Findings

- Bias scores are consistently higher for females than males across all identities. Traditional gender norms, such as expectations of kindness and family-centric roles for women, persist strongly in the data.
- Married individuals, particularly married females, exhibit the highest bias scores, reinforcing societal expectations around caregiving and family.
- The most frequently appearing bias term is *kind*, found across Hindu and Muslim females in various marital and parental statuses.
- Married Muslim women with no children are associated with *dignity*, implying a loss of dignity for those without children. Additionally, those widowed with no children are associated with *dress*, suggesting scrutiny regarding apparel.
- Muslim and Hindu males are associated with *kind* and *social*, especially when married, showing the positive sentiments associated with those meeting society's marriage expectations.
- Males, particularly Hindu and Muslim single and widowed Males, exhibit the lowest bias scores, with some cases registering 0.000.

G.17 Top Bias Terms for Bengali - To-do List

To analyze the highest bias terms from our bias lexicon in Bengali generations of daily activities from the original prompting method, we highlight all 48 identities and associated bias scores in Table 21. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.17.1 Analysis of Gender and Religion

- **Hindu Female:** The term *chore* appears as the top bias term for all Hindu female identities, with TF-IDF values ranging from 0.031 to 0.090. **This reflects a strong bias linking Hindu women to domestic tasks.** The bias scores for Hindu females are consistently high, particularly for those who are widowed with many children (0.211) and married with many children (0.205), indicating that **expectations surrounding domestic responsibilities increase with family size.**
- **Hindu Male:** The primary bias term associated with Hindu males is *responsibility*, appearing across most marital statuses. Hindu males generally have lower bias scores compared to Hindu females, with the highest bias score (0.098) observed in married men with many children, reflecting societal expectations of responsibility. Divorced males with one child are associated with *violent*, indicating harsh emotions and actions for these individuals.
- **Muslim Female:** Like Hindu females, **Muslim females are strongly associated with domestic tasks**, as *chore* appears frequently with TF-IDF values up to 0.054. Bias scores for Muslim females are consistently high, with the highest (0.168) observed for single women with many children, **reinforcing societal pressures on single mothers to manage household duties.** Divorced Muslim women with no children are associated with *traditional*, which deviates from the frequent terms surrounding domestic work.
- **Muslim Male:** **Similar to Hindu males, responsibility is the dominant term**, with TF-IDF values peaking at 0.070 for single Muslim men without children. Muslim males have moderate bias scores compared to females, but slightly higher than Hindu males, particularly for single and widowed men, **reflecting additional societal expectations placed on them.**

G.17.2 Marital Status-Based Analysis

- **Single:** Women, both Hindu and Muslim, are associated with *chore* as their highest bias term, **reinforcing domestic expectations for women.** Single men, in contrast, typically

Table 21: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **To-do List** in Bengali outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.149	chore	0.062
		One child	0.085	chore	0.031
		Many children	0.190	chore	0.050
	Married	No children	0.160	chore	0.055
		One child	0.159	chore	0.090
		Many children	0.205	chore	0.061
	Divorced	No children	0.142	chore	0.042
		One child	0.143	chore	0.059
		Many children	0.173	chore	0.048
	Widowed	No children	0.104	chore	0.052
		One child	0.123	chore	0.048
		Many children	0.211	chore	0.079
Hindu Male	Single	No children	0.043	responsibility	0.036
		One child	0.045	responsibility	0.037
		Many children	0.052	market	0.028
	Married	No children	0.064	responsibility	0.053
		One child	0.043	responsibility	0.035
		Many children	0.098	responsibility	0.073
	Divorced	No children	0.041	responsibility	0.029
		One child	0.047	violent	0.029
		Many children	0.044	market	0.015
	Widowed	No children	0.021	furnish	0.010
		One child	0.039	responsibility	0.033
		Many children	0.011	responsibility	0.011
Muslim Female	Single	No children	0.036	chore	0.025
		One child	0.150	chore	0.054
		Many children	0.168	chore	0.036
	Married	No children	0.068	clean	0.019
		One child	0.128	chore	0.043
		Many children	0.166	chore	0.030
	Divorced	No children	0.077	traditional	0.017
		One child	0.077	chore	0.028
		Many children	0.130	chore	0.045
	Widowed	No children	0.066	chore	0.016
		One child	0.089	chore	0.030
		Many children	0.098	chore	0.032
Muslim Male	Single	No children	0.087	responsibility	0.070
		One child	0.039	responsibility	0.032
		Many children	0.049	responsibility	0.049
	Married	No children	0.026	responsibility	0.017
		One child	0.057	responsibility	0.049
		Many children	0.049	responsibility	0.028
	Divorced	No children	0.048	responsibility	0.048
		One child	0.047	responsibility	0.040
		Many children	0.046	responsibility	0.026
	Widowed	No children	0.057	responsibility	0.050
		One child	0.023	responsibility	0.023
		Many children	0.055	responsibility	0.031

have *responsibility* as their top term, but with lower TF-IDF values, indicating that **men are perceived as independent rather than burdened with household duties.**

- **Married:** Married women face higher bias scores than single women, with the term *chore* still prevalent, suggesting an **increased expectation to perform household tasks after marriage.** Married men, particularly those with children, see an increase in bias scores, with *responsibility* being the dominant term, **reinforcing their role as providers.**
- **Divorced:** Bias scores remain relatively high for divorced women, with *chore* persisting as the dominant term. Divorced men

see a mix of *responsibility* and *violent* as bias terms, suggesting stereotypes related to aggression or instability. Furthermore, Muslim women with no children are associated with *traditional*, indicating an emphasis on tradition instead of household duties.

- **Widowed:** Widowed women exhibit moderate to high bias scores, particularly those with many children, reinforcing societal expectations of them as caretakers. Widowed men have lower bias scores, with *responsibility* as the primary term, suggesting they are still viewed as providers rather than domestic caretakers. **Hindu widowed males have lower bias scores than Muslim widowed males, indicating increased perception of responsi-**

bility in Hindu males.

G.17.3 Number of Children-Based Analysis

- **No children:** Women without children still have high bias scores, indicating that expectations of domestic duties persist regardless of parenthood status. Men without children have low bias scores, **reinforcing the notion that men are expected to be responsible, but this expectation is not as strong as the expectation of women to serve the home.**
- **One child:** Bias scores slightly increase for women, with *chore* as a dominant term. Men continue to be associated with *responsibility*, with only minor increases in bias scores.
- **Many children:** Women with many children see the highest bias scores across all identities, **reinforcing the traditional expectation that they are primary caregivers.** Men with many children also see increased bias scores, but still lower than women, with *responsibility* remaining the key term.

G.17.4 Summary of Findings

- Women face significantly higher bias scores than men, with *chore* as the most frequently occurring term for them across all categories.
- Men are consistently associated with *responsibility*, but their bias scores remain lower than women's, suggesting they are perceived more positively in terms of independence and authority.
- Marital status has a strong effect, with married and widowed women experiencing the highest bias scores, reinforcing societal expectations of their roles in the household.
- Hindu women show higher bias scores than Muslim women, showing an increased expectation for Hindu women to take care of household duties.
- The number of children further amplifies bias for women, while men see only slight increases, indicating that child-rearing responsibilities are disproportionately assigned to women.
- Hindu and Muslim women exhibit similar bias patterns, but Muslim men have slightly higher

bias scores than Hindu men, possibly due to prevailing stereotypes.

- Terms like *violent* appearing for divorced men suggest additional negative stereotyping, which is less present for women.

G.18 Top Overall Terms for Bengali - Story

To analyze the most frequent terms from the applications and 48 identities Bengali generations of stories under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 22. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.18.1 Analysis of Gender and Religion

- **Hindu Female:** The most common term associated with Hindu females is *woman*, appearing consistently across all marital statuses and child categories with TF-IDF values up to 0.136. This suggests that **narratives about Hindu women strongly emphasize gender identity**. Both Hindu and Muslim women are frequently associated with the term *woman*, but Hindu women have slightly higher TF-IDF values, suggesting a stronger emphasis on gender identity. The term *husband* (0.066) is more prominent among married Hindu women with no children, **showing dependence of married women on their husbands when there are no children**. Additionally, *admit* (0.089) appears for divorced Hindu women, possibly demonstrating that these women are seen as agreeable.
- **Hindu Male:** The most frequent term is *man*, found across all categories with TF-IDF values up to 0.114, indicating a strong gendered emphasis in storytelling. Married, divorced, and widowed, Hindu males frequently include the term *wife*, **reinforcing the societal expectation of spousal relationships**. The term *marry* (0.081) appears for divorced Hindu men with one child, **suggesting a narrative focus on remarriage or past relationships**.
- **Muslim Female:** Similar to Hindu females, the term *woman* dominates the narratives, showing **strong gender identity**. The term *husband* (0.077) appears for married Muslim women with no children, reinforcing spousal dependence as seen in generations for Hindu women. The presence of *admit* (0.089) among Muslim females with many children may suggest narratives of agreeableness in these individuals.
- **Muslim Male:** The term *man* appears the most across identities, mirroring Hindu males. The term *wife* appears frequently for Muslim men who are not single, similar to Hindu counterparts, indicating that **marriage remains a dominant theme in male narratives**. The presence of *one* (0.067) and *work* (0.059) for **single Muslim males suggests a potential narrative around independence and labor**. Muslim males display a notable presence of numerical terms like *one* (0.067),

which is not as frequent for Hindu males. This could reflect **storytelling patterns related to individualism, singularity, or responsibility**.

G.18.2 Marital Status-Based Analysis

- **Single:** The most common term for single individuals is their respective gender identity (*man* or *woman*). Notably, the term *work* (0.059) appears for single Muslim males, reinforcing the stereotype of male independence.
- **Married:** Across all identities, married individuals frequently feature the terms *wife* and *husband*, indicating **strong societal emphasis on spousal relationships**.
- **Divorced:** The term *marry* (0.095 for Hindu females, 0.081 for Hindu males, up to 0.092 for Muslim females, and 0.058 for Muslim males) appears frequently, **reinforcing societal narratives around remarriage expectations**. Additionally, the presence of *admit* (0.089) for **divorced Hindu women may indicate women characterized by agreeableness**.
- **Widowed:** The term *woman* appears frequently for widowed women, **reinforcing gender identity as a defining characteristic**. For widowed Muslim males, the term *man* (0.063) is present but less emphasized compared to widowed Hindu males (0.090), **possibly indicating different narrative structures around widowhood across religious contexts**.

G.18.3 Number of Children-Based Analysis

- **No Children:** Individuals with no children are primarily associated with their gender identity (*man* or *woman*). The term *wife* appears notably for married men, reinforcing spousal identity as a dominant narrative.
- **One Child:** The term *woman* remains a defining characteristic for women across all identities. **For men, the presence of *work* (0.059 for Muslim males) suggests narratives around providing for a child**.
- **Many Children:** The term *woman* appears most frequently for Hindu and Muslim females with many children, with Hindu females having the highest TF-IDF values

Table 22: Highest Overall TF-IDF terms and values for all identities under the application **Story** in Bengali outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	woman	0.082
		One child	woman	0.094
		Many children	woman	0.086
	Married	No children	husband	0.066
		One child	woman	0.068
		Many children	woman	0.118
	Divorced	No children	admit	0.089
		One child	marry	0.095
		Many children	woman	0.136
	Widowed	No children	woman	0.082
		One child	woman	0.062
		Many children	woman	0.068
Hindu Male	Single	No children	man	0.072
		One child	man	0.084
		Many children	man	0.104
	Married	No children	wife	0.094
		One child	man	0.081
		Many children	man	0.098
	Divorced	No children	wife	0.069
		One child	marry	0.081
		Many children	man	0.114
	Widowed	No children	man	0.090
		One child	wife	0.078
		Many children	man	0.101
Muslim Female	Single	No children	woman	0.091
		One child	woman	0.084
		Many children	admit	0.089
	Married	No children	husband	0.077
		One child	woman	0.064
		Many children	woman	0.097
	Divorced	No children	marry	0.092
		One child	marry	0.075
		Many children	woman	0.103
	Widowed	No children	woman	0.091
		One child	woman	0.057
		Many children	live	0.057
Muslim Male	Single	No children	one	0.067
		One child	work	0.059
		Many children	man	0.083
	Married	No children	wife	0.096
		One child	man	0.054
		Many children	man	0.078
	Divorced	No children	wife	0.108
		One child	marry	0.058
		Many children	man	0.073
	Widowed	No children	man	0.063
		One child	wife	0.088
		Many children	wife	0.062

(0.136). This suggests a strong association between motherhood and gender identity. The presence of *admit* (0.089) for Hindu females and *live* (0.057) for Muslim females indicates narratives of resilience and agreeableness. Males with no children are often associated with *man* and *wife*, indicating a connection to gender identity and spousal relationships when there are no children.

G.18.4 Summary of Findings

- Hindu and Muslim men exhibit similar trends, with *man* and *wife* appearing frequently, reinforcing traditional masculine and marital roles.
- The term *admit* appears for both Hindu and

Muslim women with many children, reflecting themes of women depicted as agreeable.

- Across all categories, the most dominant terms are *man* and *woman*, reinforcing strong gender identity markers in storytelling.
- Spousal terms (*wife*, *husband*) appear frequently for married individuals, reinforcing traditional marital expectations.
- The term *marry* frequently appears for divorced individuals, indicating strong societal expectations around remarriage.
- The presence of *work* for Muslim single men with one child reinforces a narrative of independence and labor responsibility.

G.19 Top Overall Terms for Bengali - Hobbies and Values

To analyze the most frequent terms from the applications and 48 identities Bengali generations of hobbies and values under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 23. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.19.1 Analysis of Gender and Religion

- **Hindu Female:** The dominant term across all categories is *woman* (0.083 to 0.147), reinforcing gender-specific labeling. The relatively high TF-IDF values suggest that Hindu women are often explicitly identified in text generations.
- **Hindu Male:** The frequent terms include *man* (0.090 to 0.128) and *religious* (0.072 to 0.107). The presence of *religious* suggests that Hindu men are commonly associated with religious identity, potentially reinforcing expectations of religious engagement.
- **Muslim Female:** The most frequent term is *woman* (0.139 to 0.215), appearing with higher values than for Hindu females. **This could indicate stronger gender-based labeling for Muslim women**, aligning with narratives emphasizing traditional gender roles.
- **Muslim Male:** The dominant term is *man* (0.127 to 0.234), with the highest TF-IDF among single and married categories. The term appears most frequently for married men with one child, with higher TF-IDF values in comparison to Hindu males, suggesting a **strong association between Muslim males and masculinity or family roles**.

G.19.2 Marital Status-Based Analysis

- **Single:** Single individuals are often associated with general gender labels (*man*, *woman*). This suggests a lack of specific characterization beyond gender for unmarried individuals. However, single Hindu males also have associations with *religious* and *kind*. **This shows more diversity in terms for single Hindu males than other identities**.
- **Married:** The term *man* has the highest TF-IDF value (0.234) for married Muslim males with one child. This indicates a strong connection between marriage and reinforced masculine identity. Additionally, married Muslim women with children have high associations with *woman*. **Muslims are more strongly associated with their gender identity in married statuses**. Hindu married men are associated with *religious*, while this trend does not appear for Hindu married women. **This shows Hindu married men are depicted as**

Table 23: Highest Overall TF-IDF terms and values for all identities under the application **Hobbies and Values** in Bengali outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	woman	0.099
		One child	woman	0.135
		Many children	woman	0.117
	Married	No children	woman	0.101
		One child	woman	0.147
		Many children	woman	0.100
	Divorced	No children	woman	0.105
		One child	woman	0.112
		Many children	woman	0.091
	Widowed	No children	woman	0.083
		One child	woman	0.122
		Many children	woman	0.128
Hindu Male	Single	No children	religious	0.107
		One child	kind	0.105
		Many children	man	0.127
	Married	No children	religious	0.095
		One child	religious	0.072
		Many children	man	0.099
	Divorced	No children	man	0.090
		One child	man	0.128
		Many children	religious	0.107
	Widowed	No children	religious	0.105
		One child	meditation	0.102
		Many children	man	0.103
Muslim Female	Single	No children	woman	0.172
		One child	woman	0.188
		Many children	woman	0.177
	Married	No children	woman	0.139
		One child	woman	0.215
		Many children	woman	0.191
	Divorced	No children	woman	0.168
		One child	woman	0.200
		Many children	woman	0.178
	Widowed	No children	woman	0.163
		One child	woman	0.182
		Many children	woman	0.191
Muslim Male	Single	No children	man	0.205
		One child	man	0.209
		Many children	man	0.188
	Married	No children	man	0.162
		One child	man	0.234
		Many children	man	0.173
	Divorced	No children	man	0.127
		One child	man	0.181
		Many children	man	0.150
	Widowed	No children	man	0.133
		One child	man	0.167
		Many children	man	0.136

religious leaders and value religion more than their female counterparts.

- **Divorced:** The term *woman* remains highly frequent for divorced women, but no unique terms emerge to characterize their identity beyond gender. **Muslim women are more strongly associated with their gender identity than Hindu women.** Additionally, **Muslim men and women have high associations to gender identity in comparison to Hindu identities.** In contrast, **Hindu males with many children are associated with *religious*, showing a role of religious leadership.**
- **Widowed:** The persistence of *woman* is apparent for female identities, and *man* for male

identities. Muslim widowed females still show high TF-IDF values for *woman* (up to 0.191), whereas Hindu widowed females have slightly lower values (up to 0.128), possibly indicating **less emphasis on widowhood in Hindu female narratives.** Furthermore, Hindu males have *religious* and *meditation* as frequent terms. This shows **Hindu males have diverse hobbies and values, with an emphasis towards spiritual and religious connection.**

G.19.3 Number of Children-Based Analysis

- **No children:** The term *religious* is notably present for Hindu males (up to 0.107), suggesting an association between spirituality and

men without children. Otherwise, the gender associations across all identities are maintained.

- **One child:** The term *woman* appears prominently for Muslim females (up to 0.215), **highlighting strong gender labeling in narratives involving single-child mothers.**
- **Many children:** The gender identity terms, like *man* and *woman*, remain dominant for males and females, suggesting that masculinity continues to be emphasized regardless of family size. The highest value is found for married Muslim males with one child with the term *man* (0.234), **showing a strong connection to masculinity for married men with a single child.**

G.19.4 Summary of Findings

- **Gender Differences:** Women are frequently labeled as *woman* across all categories, while men are frequently labeled as *man*. Muslim females and Muslim males have higher TF-IDF values for these terms, indicating stronger gender reinforcement.
- **Religious Identity:** Hindu men are more explicitly associated with *religious* identity, while this does not appear prominently for other identities.
- **Marital Status and Gender:** Marriage strongly reinforces masculine identity, particularly for Muslim males with one child, where *man* has the highest TF-IDF value (0.234). parenthood.

G.20 Top Overall Terms for Bengali - To-do List

To analyze the most frequent terms from the applications and 48 identities Bengali generations of daily activities under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 24. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.20.1 Analysis of Gender and Religion

- **Hindu Female:** The most common terms associated with Hindu females include *day* (TF-IDF up to 0.173) and *daily* (up to 0.217). The prominence of *daily* for those with children **suggests a structured routine.** The term *woman* (0.112) appears for those with many children, reinforcing a strong identity tied to motherhood and gender.
- **Hindu Male:** Hindu males share similar frequent terms, with *day* (up to 0.202) and *daily* (up to 0.164) being most notable. **The lack of diversity in frequent terms may be due to the model's repetition of certain words in response to prompts about daily activities.** However, the term *work* appears for widowed Hindu males (0.096), potentially reflecting societal expectations for men to remain engaged in professional life, even after losing a spouse.
- **Muslim Female:** The term *day* is again dominant (up to 0.176), along with *daily* (up to 0.148). However, divorced and married Muslim females with many children also frequently have the term *woman* (up to 0.131), similar to Hindu females, indicating **a shared emphasis on gendered identity for women across religions.**
- **Muslim Male:** Muslim men display similar frequent terms, with *day* and *daily* appearing across all identities. However, **the term mosque (up to 0.162) is particularly prominent for married, divorced, and widowed Muslim males, suggesting a stronger religious association in generations for those that are not single.** The term *man* (0.125) appears for married Muslim males with one child, **reinforcing a gendered identity similar to the use of *woman* for females.**

G.20.2 Marital Status-Based Analysis

- **Single:** Across all genders and religions, single individuals have *day* as the most frequent term (up to 0.176), suggesting a neutral and repetitive depiction of daily life in generations.
- **Married:** Married individuals, particularly those with children, frequently feature *daily* (up to 0.217), **reinforcing structured routines.** For Muslim married men, the term

Table 24: Highest Overall TF-IDF terms and values for all identities under the application **To-do List** in Bengali outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	day	0.163
		One child	day	0.173
		Many children	woman	0.112
	Married	No children	day	0.134
		One child	daily	0.217
		Many children	daily	0.110
	Divorced	No children	day	0.116
		One child	day	0.149
		Many children	day	0.124
	Widowed	No children	day	0.158
		One child	day	0.157
		Many children	daily	0.156
Hindu Male	Single	No children	day	0.173
		One child	day	0.202
		Many children	day	0.111
	Married	No children	day	0.155
		One child	daily	0.164
		Many children	day	0.111
	Divorced	No children	day	0.156
		One child	day	0.171
		Many children	daily	0.143
	Widowed	No children	day	0.140
		One child	daily	0.156
		Many children	work	0.096
Muslim Female	Single	No children	day	0.176
		One child	day	0.155
		Many children	woman	0.112
	Married	No children	day	0.152
		One child	daily	0.142
		Many children	day	0.114
	Divorced	No children	day	0.159
		One child	day	0.173
		Many children	woman	0.131
	Widowed	No children	daily	0.139
		One child	daily	0.148
		Many children	daily	0.127
Muslim Male	Single	No children	day	0.153
		One child	daily	0.157
		Many children	daily	0.173
	Married	No children	mosque	0.162
		One child	man	0.125
		Many children	daily	0.129
	Divorced	No children	mosque	0.146
		One child	daily	0.173
		Many children	mosque	0.141
	Widowed	No children	day	0.148
		One child	daily	0.173
		Many children	mosque	0.122

mosque (0.162) appears prominently, indicating **religious engagement for married Muslim men**.

- **Divorced:** Divorced individuals display *day* (up to 0.173) as a dominant term, with minimal variation. Muslim divorced males frequently feature *mosque* (up to 0.146), which is absent for other identities, reinforcing a religious narrative. Yet, the association of Muslim men with *mosque* is weaker in the divorced category than the married category, **implying a stronger religious standing for married Muslim males**.
- **Widowed:** Similar to divorced individuals, widowed individuals have *day* and *daily* as pri-

mary terms. The term ***work* (0.096)** appears only for Hindu widowed males, suggesting a continued professional life expectation.

G.20.3 Number of Children-Based Analysis

- **No Children:** The most common term is *day*, appearing consistently across all identities.
- **One Child:** The term *daily* is prominent, especially among Hindu married females, reinforcing a structured caregiving role.
- **Many Children:** Hindu and Muslim females with many children often feature *woman*, reinforcing gendered roles. Muslim males with many children prominently feature *mosque*, indicating stronger religious themes.

G.20.4 Summary of Findings

- The most frequent terms across all identities are *day* and *daily*, suggesting a repetitive format in generated content, and indication of structured routines for all identities.
- Muslim males, particularly those who are married, divorced, or widowed, have the term *mosque* more frequently, reinforcing religious narratives.
- Hindu and Muslim females with many children have the term *woman* frequently, reinforcing traditional maternal roles.
- The lack of diverse vocabulary, with repeated words like *day* and *daily*, suggests that Bengali generations are constrained by low-resource limitations (Faria et al., 2024), leading to high similarity with prompt tokens.

G.21 Top Bias Terms for Punjabi - Story

To analyze the highest bias terms from our bias lexicon in Punjabi story generations from the original prompting method, we highlight all 48 identities and associated bias scores in Table 25. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.21.1 Analysis of Gender and Religion

- **Hindu Female:** The dominant bias terms for Hindu females in Punjabi story generations are *house* and *family*, with Bias TF-IDF values reaching up to 0.028. **These terms consistently appear across all marital statuses and childbearing statuses, reinforcing traditional gender roles where women are primarily associated with domestic spaces.** Notably, married Hindu females show the highest bias score (0.096), emphasizing societal expectations of them as homemakers.
- **Hindu Male:** For Hindu males, the most frequent bias terms are *poor* and *fight*, with Bias TF-IDF values reaching 0.014. The highest bias scores are for those married with many children (0.042) with the top term *good* and divorced with no children with the top term *fight*. **This indicates a positive attitude towards those who meet societal expectations, and attitudes of conflict for those who do not.** Unlike Hindu females, Hindu males are not predominantly associated with domestic roles. The bias scores for Hindu males are relatively lower, with single and widowed Hindu males having the least bias.
- **Muslim Female:** Muslim females are also strongly associated with domestic-related terms such as *house* and *family*, with Bias TF-IDF values reaching up to 0.023. **The highest bias scores appear in married (0.080) and divorced (0.062) Muslim females, suggesting that traditional gender roles are reinforced.** The presence of the term *death* for widowed Muslim females (TF-IDF up to 0.014) indicates a potential stigma or detailed narratives regarding spousal death.
- **Muslim Male:** Muslim males have more varied terms, including *force* and *fight*, with TF-IDF values up to 0.008. While their bias scores are lower than those of Muslim females, the term *force* for both single and widowed Muslim males suggests a possible association with stereotypes of aggression or control. Similar to divorced Hindu males, divorced Muslim males are also associated with *fight*, although this association is slightly weaker as seen through lower Bias TF-IDF values.

Table 25: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Story** in Punjabi outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.041	house	0.009
		One child	0.052	house	0.009
		Many children	0.057	house	0.013
	Married	No children	0.096	house	0.028
		One child	0.077	family	0.011
		Many children	0.083	family	0.016
	Divorced	No children	0.050	home	0.013
		One child	0.072	house	0.020
		Many children	0.048	family	0.014
	Widowed	No children	0.041	house	0.008
		One child	0.034	house	0.012
		Many children	0.056	house	0.024
Hindu Male	Single	No children	0.018	poor	0.005
		One child	0.024	poor	0.002
		Many children	0.017	poor	0.004
	Married	No children	0.017	empty	0.004
		One child	0.025	happy	0.005
		Many children	0.042	good	0.005
	Divorced	No children	0.038	fight	0.014
		One child	0.030	fight	0.007
		Many children	0.024	fight	0.003
	Widowed	No children	0.010	strong	0.003
		One child	0.012	back	0.002
		Many children	0.023	strong	0.004
Muslim Female	Single	No children	0.041	house	0.011
		One child	0.044	home	0.010
		Many children	0.047	family	0.012
	Married	No children	0.080	house	0.023
		One child	0.058	family	0.009
		Many children	0.057	house	0.011
	Divorced	No children	0.047	house	0.009
		One child	0.062	house	0.021
		Many children	0.043	family	0.013
	Widowed	No children	0.031	death	0.004
		One child	0.038	death	0.012
		Many children	0.059	house	0.016
Muslim Male	Single	No children	0.017	force	0.004
		One child	0.020	autonomous	0.004
		Many children	0.023	pressure	0.004
	Married	No children	0.029	good	0.006
		One child	0.035	good	0.008
		Many children	0.022	grow	0.003
	Divorced	No children	0.015	fight	0.003
		One child	0.022	fight	0.006
		Many children	0.014	bad	0.006
	Widowed	No children	0.022	force	0.003
		One child	0.010	force	0.002
		Many children	0.009	bad	0.002

G.21.2 Marital Status-Based Analysis

- **Single Individuals:** Single Hindu and Muslim women are consistently associated with *house* and *home*, reflecting traditional expectations of women being linked to domestic spaces regardless of marital status. Meanwhile, single men, particularly Hindu males, have lower bias scores and are associated with *poor*, indicating pity for those that are unmarried. Muslim single males have more diverse top terms such as *force*, *pressure*, and *autonomous*, emphasizing control and independence.
- **Married Individuals:** Married Hindu and Muslim women show the highest bias scores, especially linked to terms like *house* and *fam-*

ily. The term *family* appears more for married women with children, reinforcing the expectation of child-rearing responsibilities. **Married males are associated with *good* and *happy*, showing fulfillment in marriage.** Yet, **Hindu married males with no children are described often with *empty*, displaying a void for those without children.**

- **Divorced Individuals:** Divorced Hindu and Muslim women have higher bias scores than their male counterparts, with terms like *house* and *home* appearing frequently. The presence of *fight* for divorced Hindu males (TF-IDF up to 0.014) and divorced Muslim males (TF-IDF up to 0.006) **indicates a possible narrative of conflict surrounding divorce.**

- **Widowed Individuals:** Widowed women, particularly Muslim females, are associated with *death*, suggesting societal framing of widowhood as a tragic or isolated state. Hindu widowed women also show bias with terms like *house*, reinforcing continued domestic association. Hindu widowed males are associated with *strong*, whereas Muslim widowed males are associated with *force* and *bad*. **This indicates Hindu widowed males are seen as powerful, while Muslim counterparts are seen negatively.**

G.21.3 Number of Children-Based Analysis

- **No Children:** Women without children, both Hindu and Muslim, show strong associations with *house* and *home*, reinforcing a domestic role regardless of childbearing. **Bias scores are highest for married women with no children, suggesting additional societal expectations regarding reproduction.**
- **One Child:** The term *family* appears for women with one child, emphasizing caregiving roles. Bias scores remain high, especially for married and divorced women. Divorced women with one child have relatively high bias scores.
- **Many Children:** For both Hindu and Muslim females with many children, the term *house* continues to dominate, with higher TF-IDF values. This suggests that as the number of children increases, the association with the home remains strong. Hindu and Muslim males with many children have lower bias scores, **reinforcing the trend that child-rearing responsibilities are more closely tied to women.**

G.21.4 Summary of Findings

- Women, particularly married and divorced women, face the strongest gendered biases, with Hindu and Muslim females associated primarily with *house*, *home*, and *family*, reinforcing traditional expectations.
- Hindu and Muslim men exhibit lower bias scores overall. Some bias terms such as *poor* (single Hindu males) and *force* (Muslim males) appearing, *empty* (Hindu males with no children) suggesting pity, control, and reproductive stigmas.

- Married and divorced individuals experience higher bias scores than single individuals, particularly women, as seen in their strong association with domestic roles.
- Widowed females show bias through the term *death*, indicating negative societal perceptions of widowhood or narratives about spousal loss.
- Bias scores and TF-IDF values indicate a strong reinforcement of gender norms, where women are linked to caregiving and men to economic and conflict-based roles.

G.22 Top Bias Terms for Punjabi - Hobbies and Values

To analyze the highest bias terms from our bias lexicon in Punjabi generations of hobbies and values from the original prompting method, we highlight all 48 identities and associated bias scores in Table 26. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.22.1 Analysis of Gender and Religion

- **Hindu Female:** The term *family* appears consistently as the highest bias term across all marital statuses and number of children. The Bias TF-IDF values reach up to 0.050 for single with no children, and bias scores reaching 0.124 for married with many children. **This suggests a strong societal expectation that Hindu women, irrespective of their marital or parental status, are closely associated with family roles.** The bias scores for Hindu females are generally high, particularly for those who are married (0.065 to 0.124) and those with many children (up to 0.124), reinforcing the traditional expectation of women's role within the family structure.
- **Hindu Male:** The term *violent* appears frequently, particularly for single (bias scores up to 0.018) and married (bias scores up to 0.052) Hindu males, **indicating a subtle bias linking Hindu men with aggression.** Other terms such as *strong* (up to 0.013) and *social* (up to 0.044) indicate some positive and social attributes, but **these biases appear less frequently compared to the family-related bias seen in Hindu females.** Hindu males generally have lower bias scores than Hindu females, with several identities showing low bias scores, particularly among divorced and widowed individuals.
- **Muslim Female:** Similar to Hindu females, the term *family* appears frequently, with Bias TF-IDF values reaching 0.093 for married individuals. Terms like *love* (0.071) and *kind* (0.093) for **married Muslim women suggest an additional expectation of emotional warmth and nurturing roles.** The bias scores for Muslim females range from moderate to high, reinforcing gendered expectations similar to Hindu females.
- **Muslim Male:** The highest bias terms for Muslim males include *independent* (0.013) and *love* (up to 0.009), which **contrast with the violent stereotype sometimes associated with Hindu men.** However, terms like *struggle* (0.011) and *difference* (0.010) for **divorced individuals suggest some bias in portraying them as outcasts and victims of hardship.** Muslim males have lower bias

scores compared to females, indicating fewer strong stereotypes in this category.

G.22.2 Marital Status-Based Analysis

- **Single:** Hindu and Muslim single females show high association with *family* (TF-IDF up to 0.050), indicating an **expectation of women prioritizing family even when unmarried.** Single Hindu males show *violent* (0.018) as a key term, suggesting a potential **negative stereotype of aggression** or recklessness. Whereas **Muslim single males have lower bias scores and are linked to more neutral terms** like *object* (0.006) and *moderate* (0.005), reflecting men as objective.
- **Married:** Family-related terms dominate across both Hindu and Muslim females, reinforcing traditional expectations of marriage and home life. Hindu males show a mix of social traits (*social*, 0.013) and some aggression (*violent*, 0.012), indicating **a blend of leadership and potential conflict-related bias.** Muslim males and females are linked to *love*, reflecting an emphasis on relationships in marriage.
- **Divorced:** Divorced Hindu and Muslim females still show a strong connection to *family*, **reinforcing societal perceptions that their role remains family-centric despite separation.** Hindu divorced males are linked to *moderate* and *control*, **potentially reflecting bias related to restraint or adjusting to new social roles.** Muslim divorced males show terms like *difference* and *struggle*, **indicating an expectation of hardship post-divorce.**
- **Widowed:** Bias scores for widowed women remain moderate, with *family* and related terms persisting across all cases. Hindu and Muslim widowed males, on the other hand, are associated with terms like *strong* and *confidence*, **suggesting a more resilient or independent framing compared to widowed women.**

G.22.3 Number of Children-Based Analysis

- **No Children:** Across all identities, *family* remains a dominant term, even for those without children, indicating societal expectations of familial involvement regardless of parental status. Hindu males with no children are linked

Table 26: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Hobbies and Values** in Punjabi outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF

		One child	0.028	confidence	0.009
		Many children	0.023	strong	0.008

to *violent* and *control*, suggesting a potential bias that unmarried and childless men are seen as more aggressive. On the other hand, Muslim males are associated with *object*, *strong*, and *difference*. This shows Muslim males with no children are still seen positively, although sometimes considered outcasts.

- **One Child:** Family remains a strong term for women across both religious groups. Muslim and Hindu males are associated with terms like *provide*, reflecting expectations of them as providers and caretakers.
- **Many Children:** Hindu and Muslim women continue to have high bias scores, reinforcing

the expectation that **motherhood is central to their identity**. Hindu and Muslim males with many children show terms like *strong* and *independent*, emphasizing resilience and self-sufficiency in fathers. However, Muslim males that are divorced with many children are associated with *struggle*, showing hardship for single fathers.

G.22.4 Summary of Findings

- Women, regardless of religion, show high bias scores and are most frequently linked with *family*, reinforcing traditional gender roles.
- Hindu males are sometimes linked with aggression (*violent*), while Muslim males show terms related to relationships (*love*, *happiness*)

(*difference*, and *struggle*).

- Marriage strongly reinforces family-related biases, especially for women. Divorced and widowed women retain family associations, while men show more independence-related terms.
- Having children does not significantly change bias for women (family-related terms persist), but men with many children gain associations with strength and responsibility.
- Societal biases are more pronounced for women, particularly in relation to marriage and family expectations. Hindu males show slightly stronger negative biases, while Muslim males have a mix of neutral and relationship-focused biases.

G.23 Top Bias Terms for Punjabi - To-do List

To analyze the highest bias terms from our bias lexicon in Punjabi generations of daily activities from the original prompting method, we highlight all 48 identities and associated bias scores in Table 27. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.23.1 Analysis of Gender and Religion

- **Hindu Female:** The dominant bias term for Hindu females is *chore*, appearing across all marital statuses and child counts. The highest bias score is found in married Hindu females with many children (0.258). The strong association with *chore* suggests a bias linking Hindu women, particularly married ones, with household responsibilities. **Hindu females show consistently high bias scores (above 0.18), indicating significant societal expectations related to domestic work.**
- **Hindu Male:** The dominant bias term is *responsibility*, found across all statuses with lower bias scores than females. The highest bias score is for married Hindu males with no children. The bias scores for single Hindu males are notably low (0.011–0.020), **reflecting the societal perception of unmarried men as independent.** Yet, divorced males with many children are associated with *violent*, showing a stereotype of aggression. Additionally, married men with many children are associated with *happy*, **reinforcing the idea that marriage and increased family size leads to fulfillment.**
- **Muslim Female:** Similar to Hindu females, *chore* is the most frequent bias term, reinforcing gendered expectations of domestic work. The highest bias score appears in married Muslim females with many children (0.248). Muslim females generally show higher bias scores than Muslim males, suggesting stronger societal expectations of household roles. Generally, across most identities, **Muslim females have lower bias scores than Hindu females.**
- **Muslim Male:** Unlike females, Muslim males are linked with *responsibility*, *freedom*, and *social*. The highest bias score appears in married Muslim males with one child (0.089), where *social* (0.029) is the dominant term. This suggests **married men are seen as friendly and sociable, and single men are seen as independent.** Muslim males have lower bias scores than Muslim females, **reflecting reduced societal expectations.** Additionally, the bias scores are lower for Muslim males indicating more neutral terms associated with Muslim males than other identities.

Table 27: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **To-do List** in Punjabi outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.215	chore	0.090
		One child	0.204	chore	0.070
		Many children	0.187	chore	0.069
	Married	No children	0.239	chore	0.069
		One child	0.255	chore	0.083
		Many children	0.258	chore	0.054
	Divorced	No children	0.202	chore	0.082
		One child	0.215	chore	0.071
		Many children	0.186	chore	0.048
	Widowed	No children	0.189	chore	0.065
		One child	0.202	chore	0.046
		Many children	0.210	family	0.041
Hindu Male	Single	No children	0.011	responsibility	0.011
		One child	0.020	responsibility	0.010
		Many children	0.011	responsibility	0.011
	Married	No children	0.069	responsibility	0.047
		One child	0.063	responsibility	0.037
		Many children	0.040	happy	0.014
	Divorced	No children	0.032	responsibility	0.012
		One child	0.032	responsibility	0.017
		Many children	0.057	violent	0.027
	Widowed	No children	0.034	responsibility	0.014
		One child	0.040	responsibility	0.018
		Many children	0.040	responsibility	0.018
Muslim Female	Single	No children	0.152	chore	0.057
		One child	0.153	chore	0.056
		Many children	0.200	chore	0.067
	Married	No children	0.177	chore	0.068
		One child	0.237	chore	0.082
		Many children	0.248	chore	0.061
	Divorced	No children	0.166	chore	0.062
		One child	0.171	chore	0.070
		Many children	0.138	chore	0.044
	Widowed	No children	0.081	chore	0.040
		One child	0.130	chore	0.047
		Many children	0.181	chore	0.055
Muslim Male	Single	No children	0.015	freedom	0.008
		One child	0.037	responsibility	0.008
		Many children	0.021	provide	0.008
	Married	No children	0.070	responsibility	0.022
		One child	0.089	social	0.029
		Many children	0.046	social	0.010
	Divorced	No children	0.032	responsibility	0.014
		One child	0.017	responsibility	0.012
		Many children	0.028	difference	0.011
	Widowed	No children	0.025	responsibility	0.018
		One child	0.012	responsible	0.006
		Many children	0.040	obligation	0.011

G.23.2 Marital Status-Based Analysis

- **Single:** Single Hindu and Muslim males have low bias scores, often linked with *responsibility* or *freedom*. In contrast, single females are associated with *chore* and show significantly higher bias scores, indicating a strong gendered stereotype.
- **Married:** Married women (both Hindu and Muslim) exhibit the highest bias scores in their categories, with *chore* as the dominant term. Married men have higher bias scores than single men but are linked to *responsibility* rather than domestic duties. This shows **married men are seen as responsible providers, and married women as domestic caretakers**. Furthermore, married men are associated

with *happy* and *social*, indicating positive descriptions towards those who meet societal marriage expectations.

- **Divorced:** Divorced women, like married women, are strongly linked to *chore* with moderate to high bias scores. Divorced men have lower bias scores, often linked with *responsibility*. This **suggests a societal perception that divorced women continue household roles, while men face less expectation**. However, **Hindu and Muslim males are associated most with *violent* and *difference*, demonstrating trends of aggression and isolation**.
- **Widowed Individuals:** Bias scores for wid-

widowed women remain relatively high, especially for Hindu widows (up to 0.210), with terms like *chore* and *family*. Widowed men have lower bias scores and are associated with *responsibility*. This highlights a societal expectation that widowed women maintain domestic responsibilities.

G.23.3 Number of Children-Based Analysis

- **No Children:** Hindu and Muslim women without children show moderate to high bias scores, while Hindu women have higher bias scores, with *chore* as the frequent term. Men without children have much lower bias scores, reflecting reduced societal expectations regarding household duties.
- **One Child:** Bias scores remain high for women, still linked to *chore*. Men with one child are mainly associated with *responsibility*.
- **Many Children:** Women with many children continue to exhibit moderate to high bias scores. Men show moderate bias scores, with an outlier for divorced Hindu men (bias score of 0.057), linked to *violent*), reflecting a stereotype of violence and anger. Furthermore, widowed Muslim males with many children are tied to *obligation* while single Muslim males with many children are linked to *provide*. This shows although top terms may differ from *responsibility*, **the underlying theme of provision and leadership for a family is persistent for males.**

G.23.4 Summary of Findings

- *Chore* appears overwhelmingly for women, particularly Hindu and Muslim females, across all marital statuses.
- *Responsibility* is the dominant term for men, appearing across identities but with lower bias scores.
- *Social* appears for married and divorced Muslim men, while *violent* appears for divorced Hindu men with many children.
- Married Hindu and Muslim females exhibit the highest bias scores, consistently linked to household tasks. Whereas Hindu and Muslim males, especially single men, have significantly lower bias scores. Widowed and

divorced women have high bias scores in comparison to males, reinforcing gendered expectations post-marriage.

- Marriage highly increases bias scores for women, while for men, it results in only a moderate increase. Parenthood intensifies the expectation of responsibility for men but does not significantly alter household-related biases for women.

G.24 Top Overall Terms for Punjabi - Story

To analyze the most frequent terms from the applications and 48 identities Punjabi generations of stories under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 28. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.24.1 Analysis of Gender and Religion

- **Hindu Female:** The most common terms include *work* (TF-IDF up to 0.051), *woman* (up to 0.043), and *marry* (up to 0.058). The prominence of *marry* across multiple categories, particularly for divorced women, suggests societal emphasis on marriage and remarriage.
- **Hindu Male:** Key terms include *work* (up to 0.041), *marry* (up to 0.051), and *doctor* (0.050). The association of Hindu men with professions like *doctor* aligns with career-oriented expectations. **The term *marry* appearing for divorced men, suggests a focus on remarriage but with slightly lower intensity than for Hindu females.**
- **Muslim Female:** Frequently occurring terms include *woman* (up to 0.047), *work* (up to 0.051), and *marry* (0.040). Compared to Hindu females, *woman* is even more prominent in Muslim female narratives, **suggesting identity reinforcement in storytelling.**
- **Muslim Male:** The dominant terms include *work* (up to 0.044), *marry* (0.051 to 0.055), and *house* (0.049). The presence of *house* in narratives of widowed Muslim males with many children suggests themes of household and family.

G.24.2 Marital Status-Based Analysis

- **Single Individuals:** The most frequent terms are *two* (up to 0.047) and *work* (up to 0.050). The term *two* may reflect numerical references to family members in storytelling. *work* is higher for Hindu females (0.050) than other identities, **indicating narratives with women employed or working within the home.**
- **Married Individuals:** Prominent terms include *wife*, *son*, *father*, and *woman*. The reinforcement of spousal and familial roles is evident across both genders.
- **Divorced Individuals:** The most common term is *marry* (up to 0.058), appearing for both genders. This shows **divorced individuals are commonly described with lacking a marriage across all identities.** This association is more prevalent for Muslim males and Hindu females. This suggests strong societal narratives emphasizing remarriage after divorce.

- **Widowed Individuals:** Frequently mentioned terms include *work* for those with no children. This indicates that **after spousal death, people are expected to focus on their career and duties.** Widowed individuals are also associated with *house*, with a strong association for males. **This may indicate more domestic and family related narratives for widowed males.**

G.24.3 Number of Children-Based Analysis

- **No Children:** Common terms include *work*, *two*, and *marry*. This suggests a focus on either career or marriage in narratives of childless individuals.
- **One Child:** Frequently mentioned terms include *son*, *wife*, *father*, and *marry*, reinforcing family relationships.
- **Many Children:** The most common terms include *house*, *marry*, *work*, and *two*. This shows an association with responsibilities, duties, and relationships, and family size increases.

G.24.4 Summary of Findings

- **Gender Bias:** Women, particularly Hindu and Muslim females, are frequently associated with *work* and *woman*, suggesting a focus on either employment or gender identity. Hindu males are linked to professional roles like *doctor*, whereas Muslim males show a stronger association with *house*, especially in widowed cases, indicating familial responsibilities.
- **Religious Trends:** Muslim females exhibit a higher frequency of *woman* in generated narratives compared to Hindu females, reinforcing gender identity within storytelling. Muslim males, especially those widowed with many children, show strong associations with *house*, reflecting narratives of domestic and familial duties.
- **Marital Expectations:** The term *marry* appears prominently across divorced individuals, particularly for Hindu females and Muslim males, reflecting strong societal emphasis on remarriage. For single individuals, *work* is notably high, especially for Hindu females, suggesting either professional engagement or domestic labor.

Table 28: Highest Overall TF-IDF terms and values for all identities under the application **Story** in Punjabi outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	two	0.041
		One child	work	0.050
		Many children	woman	0.043
	Married	No children	two	0.039
		One child	son	0.034
		Many children	work	0.051
	Divorced	No children	marry	0.058
		One child	marry	0.038
		Many children	marry	0.058
	Widowed	No children	work	0.044
		One child	die	0.039
		Many children	house	0.034
Hindu Male	Single	No children	two	0.033
		One child	work	0.035
		Many children	doctor	0.050
	Married	No children	two	0.043
		One child	father	0.027
		Many children	work	0.041
	Divorced	No children	marry	0.048
		One child	marry	0.042
		Many children	marry	0.051
	Widowed	No children	work	0.048
		One child	son	0.028
		Many children	house	0.046
Muslim Female	Single	No children	two	0.047
		One child	work	0.038
		Many children	woman	0.046
	Married	No children	two	0.036
		One child	woman	0.036
		Many children	woman	0.038
	Divorced	No children	woman	0.037
		One child	marry	0.040
		Many children	woman	0.047
	Widowed	No children	work	0.051
		One child	woman	0.036
		Many children	two	0.031
Muslim Male	Single	No children	go	0.045
		One child	work	0.038
		Many children	two	0.036
	Married	No children	two	0.041
		One child	wife	0.034
		Many children	work	0.037
	Divorced	No children	marry	0.055
		One child	marry	0.053
		Many children	marry	0.051
	Widowed	No children	work	0.044
		One child	wife	0.038
		Many children	house	0.049

- **Children-Based Differences:** Individuals with many children are frequently linked to *house*, reinforcing traditional parental and domestic roles. Widowed individuals without children are more commonly associated with *work*, indicating a societal expectation to focus on career and duties after spousal loss.
- **Familial Roles:** Married individuals exhibit strong associations with *wife*, *son*, and *father*, reinforcing spousal and parental identities. Those with one child show increased emphasis on family-related terms such as *son* and *wife*, highlighting parental and spousal responsibilities.

G.25 Top Overall Terms for Punjabi - Hobbies and Values

To analyze the most frequent terms from the applications and 48 identities Punjabi generations of hobbies and values under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 29. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.25.1 Analysis of Gender and Religion

- **Hindu Female:** A frequent term for Hindu females is *woman*, appearing prominently across all marital statuses and child counts. This suggests a **strong gendered identity in hobbies and values-related outputs**. Additionally, the term *entertainment* is present across identities, indicating a possible **association between women and leisure or cultural activities**.
- **Hindu Male:** The most frequent term is *entertainment*, particularly for single Hindu males (TF-IDF up to 0.184). This suggests that hobbies and values **narratives for Hindu men emphasize entertainment more than for Hindu women**. The term *father* appears for married men with children (0.108), **reinforcing a family-centric identity**. For widowed males with no children, *religious* is a common term, **indicating religious values in times of spousal loss for those without children**.
- **Muslim Female:** Similar to Hindu females, the term *woman* appears frequently (up to 0.166), with the highest values observed for those with many children (0.153 to 0.166). **This suggests an emphasis on traditional gender roles, particularly in relation to motherhood**. Unlike Hindu females, Muslim females do not have *entertainment* as a frequent term, indicating a possible difference in leisure-related associations.
- **Muslim Male:** Hindu males are significantly associated with *entertainment*, whereas **Muslim males display more varied frequent term distributions, including *father*, *mind*, and *religious***. The most frequent term for Muslim males varies. While *father* appears in multiple instances, terms like *mind* (0.063) and *religious* (0.051) are more unique to few identities. This may suggest a **greater association of Muslim males with intellectual or religious considerations compared to their Hindu counterparts**.

G.25.2 Marital Status-Based Analysis

- **Single:** The term *entertainment* is dominant among single Hindu identities, with the highest TF-IDF for Hindu single men. In contrast, Muslim single females are more associated with the term *woman* and Muslim males often

associated with *father*, **reinforcing a gender-centric and family-oriented narrative for Muslims, instead of a focus on leisure activities**.

- **Married:** Married men across religions frequently have terms linked to familial roles, such as *father* (0.108 for Hindu men) and *husband* (up to 0.085 for Muslim men). For married women, *woman* remains the most common term, suggesting a continued emphasis on gender identity regardless of number of children. **There is a focus on gender identity, as well as spousal and parental roles**.
- **Divorced:** The consistent term *entertainment* is notable among divorced Hindu males (up to 0.136), while divorced Muslim men are associated with *father* (0.068) more than *entertainment*. This may indicate differing narratives around post-marriage identity, with **Hindu men focusing more on leisure and Muslim men on family**. Muslim females are consistently associated with *woman*, whereas Hindu females generally show this pattern, with some term diversity seen by *entertainment*.
- **Widowed:** For widowed men, the terms *entertainment* (up to 0.121 for Hindu males, 0.054 for Muslim males) appear, demonstrating leisure activities. However, Hindu widowed males with no children are associated with *religious* and Muslim widowed males with many children are associated with *mind*. **This may indicate a shift toward philosophical or spiritual concerns in life**. Women, on the other hand, are **consistently associated with *woman*, showing emphasis on gender identity, and this emphasis is stronger for Muslim women than Hindu women**.

G.25.3 Number of Children-Based Analysis

- **No children:** Single and married individuals without children display varied term distributions. For Hindu males, *entertainment* is dominant, although Hindu females are sometimes associated with this term as well. For females, the term *woman* is consistently the most frequent. Muslim men, *mind*, *religious*, and *may*, appear, **indicating more intellectual and spiritual focuses for those without children**.

Table 29: Highest Overall TF-IDF terms and values for all identities under the application **Hobbies and Values** in Punjabi outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	entertainment	0.104
		One child	woman	0.121
		Many children	entertainment	0.103
	Married	No children	recreational	0.065
		One child	woman	0.078
		Many children	woman	0.097
	Divorced	No children	entertainment	0.056
		One child	woman	0.089
		Many children	woman	0.077
	Widowed	No children	woman	0.053
		One child	woman	0.083
		Many children	woman	0.087
Hindu Male	Single	No children	entertainment	0.184
		One child	entertainment	0.144
		Many children	entertainment	0.110
	Married	No children	entertainment	0.096
		One child	father	0.108
		Many children	entertainment	0.069
	Divorced	No children	entertainment	0.112
		One child	entertainment	0.082
		Many children	entertainment	0.136
	Widowed	No children	religious	0.073
		One child	entertainment	0.121
		Many children	entertainment	0.098
Muslim Female	Single	No children	woman	0.107
		One child	woman	0.114
		Many children	woman	0.153
	Married	No children	woman	0.105
		One child	woman	0.128
		Many children	woman	0.166
	Divorced	No children	woman	0.076
		One child	woman	0.148
		Many children	woman	0.127
	Widowed	No children	woman	0.118
		One child	woman	0.090
		Many children	woman	0.106
Muslim Male	Single	No children	mind	0.063
		One child	father	0.092
		Many children	father	0.106
	Married	No children	may	0.068
		One child	husband	0.059
		Many children	husband	0.085
	Divorced	No children	religious	0.051
		One child	entertainment	0.059
		Many children	father	0.068
	Widowed	No children	may	0.047
		One child	entertainment	0.054
		Many children	mind	0.039

- **One child:** The term *father* appears in Hindu and Muslim males, reinforcing parental values. For females, *woman* remains the dominant term, indicating an emphasis on personal gender identity.
- **Many children:** Women with many children, particularly Muslim females, show an increased TF-IDF for *woman*. This suggests that **motherhood does not introduce a new dominant term but rather amplifies existing gendered identities**. Hindu males with many children still have *entertainment* present, while Muslim males are linked to *father* and *husband*. This may indicate **Hindu males are described with independent in-**

terests, whereas Muslim males are seen as more family-oriented.

G.25.4 Summary of Findings

- **Gender bias is strong:** Women are overwhelmingly represented by the term *woman*, with little variation in their hobbies and values, suggesting a gender-restrictive narrative.
- **Hindu men are more associated with entertainment:** Across all statuses, Hindu men feature *entertainment* more prominently than any other group.
- **Muslim men have a wider distribution of identity terms:** While Hindu males focus on entertainment, Muslim males are associated

with *father*, *mind*, and *religious*, indicating a more diverse range of narratives.

- **Marital status influences term emphasis:** Married and widowed individuals show a stronger association with familial or religious terms (*father*, *husband*, *religious*), while single and divorced individuals are more likely to feature *entertainment*.
- **Children reinforce gendered roles:** Fathers are identified as *father*, while mothers remain categorized simply as *woman*, highlighting an asymmetry in parental role recognition.

G.26 Top Overall Terms for Punjabi - To-do List

To analyze the most frequent terms from the applications and 48 identities Punjabi generations of daily activities under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 30. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.26.1 Analysis of Gender and Religion

- **Hindu Female:** The most frequent terms for Hindu females include *daily* (TF-IDF up to 0.122) and *chore* (up to 0.100). The term ***chore* appears frequently for those with children, reinforcing gendered expectations of women managing household tasks.** The presence of *daily* across marital statuses and child statuses suggests a focus on routine activities.
- **Hindu Male:** Prominent terms for Hindu males include *daily* (up to 0.103), *day* (up to 0.083), and *chore* (up to 0.093). While *daily* appears frequently, *day* emerges more for single and widowed Hindu males. **The presence of *chore* and *family* (0.067) for married Hindu males highlights family-centric responsibilities.**
- **Muslim Female:** The highest TF-IDF values appear for *daily* (up to 0.192), with the highest occurrence among widowed and divorced Muslim females. Muslim women display higher TF-IDF values for *daily* compared to Hindu women, particularly among widowed and divorced groups. **This suggests a stronger association with structured routines in comparison to Hindu females, possibly due to societal expectations or religious practices.** The term *chore* (up to 0.100) is also frequent, indicating **strong domestic associations.** Additionally, *woman* (0.072) appears for divorced Muslim females with many children, **which may reflect a focus on identity as a woman in household or social contexts.**
- **Muslim Male:** Common terms include *daily* (up to 0.122), *chore* (0.060), and *father* (0.092). The presence of *father* among Muslim males with many children highlights paternal identity, which does not appear prominently for Hindu males, **suggesting a stronger paternal narrative in Muslim contexts.** The emphasis on *daily* across all categories indicates structured routines, with a weaker presence compared to Hindu males.

G.26.2 Marital Status-Based Analysis

- **Single Individuals:** For single women and men, *daily* and *day* appears frequently, indicating structured activities. This structured

Table 30: Highest Overall TF-IDF terms and values for all identities under the application **To-do List** in Punjabi outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	daily	0.120
		One child	daily	0.104
		Many children	chore	0.100
	Married	No children	chore	0.089
		One child	daily	0.122
		Many children	chore	0.077
	Divorced	No children	daily	0.118
		One child	chore	0.098
		Many children	chore	0.064
	Widowed	No children	daily	0.120
		One child	daily	0.102
		Many children	daily	0.092
Hindu Male	Single	No children	day	0.083
		One child	daily	0.103
		Many children	day	0.077
	Married	No children	family	0.067
		One child	chore	0.074
		Many children	chore	0.059
	Divorced	No children	daily	0.076
		One child	daily	0.099
		Many children	chore	0.093
	Widowed	No children	daily	0.085
		One child	day	0.068
		Many children	chore	0.080
Muslim Female	Single	No children	daily	0.141
		One child	daily	0.137
		Many children	chore	0.100
	Married	No children	daily	0.166
		One child	daily	0.131
		Many children	chore	0.099
	Divorced	No children	daily	0.127
		One child	daily	0.191
		Many children	woman	0.072
	Widowed	No children	daily	0.192
		One child	daily	0.123
		Many children	daily	0.107
Muslim Male	Single	No children	daily	0.116
		One child	daily	0.096
		Many children	father	0.092
	Married	No children	daily	0.083
		One child	daily	0.103
		Many children	chore	0.060
	Divorced	No children	daily	0.100
		One child	daily	0.122
		Many children	home	0.048
	Widowed	No children	daily	0.115
		One child	daily	0.122
		Many children	daily	0.061

association is stronger for Muslim females, possibly indicating routine in Islamic practice.

- **Married Individuals:** Married women and Muslim frequently feature both *daily* and *chore*. While Hindu married men display *chore* and *family* (0.067). **This suggests that Hindu men’s responsibilities may be framed more broadly within a family context rather than structured domestic work.**
- **Divorced and Widowed Individuals:** Divorced and widowed Muslim women have the highest TF-IDF values for *daily* (up to 0.192), emphasizing a structured routine. Hindu divorced individuals maintain high values for *daily*, but TF-IDF values are lower than for

Muslim females. Widowed identities maintain routine associations with *daily*, while Hindu males also incorporate *chore*, showing a shift towards domestic responsibilities.

G.26.3 Number of Children-Based Analysis

- **No Children:** Across all identities, individuals without children frequently mention *daily*, suggesting structured personal routines. **Hindu married males uniquely mention *family* (0.067), reflecting a non-child-focused familial emphasis.**
- **One Child:** Individuals with one child show a high frequency of *daily*, particularly among Muslim women. Hindu women also maintain high TF-IDF values for *daily*. Hindu males

and Hindu females sometimes display *chore*, which is less emphasized in Muslim contexts. This may suggest that **Hindu identities with one child are more associated with chores.**

- **Many Children:** Women and men with many children commonly feature *chore*, **highlighting domestic responsibilities across all identities as family size increases.** Single Muslim males with many children uniquely display *father* and divorced Muslim males display *home*, which is absent for Hindu males. This implies that **Muslim males with many children are more commonly associated with their household and parental role.**

G.26.4 Summary of Findings

- **Gendered Language Use:** Men and women, regardless of religion, frequently feature *daily* and *chore*, reinforcing domestic associations. Meanwhile, men, particularly Muslim men with children, display *father*, reinforcing paternal identity.
- **Religious Trends:** Muslim women have the highest TF-IDF values for *daily*, particularly among widowed and divorced individuals. Hindu men emphasize *family*, while Muslim men uniquely highlight *father*.
- **Marital Status and Bias:** Widowed and divorced individuals, particularly Muslim females, show a heightened emphasis on structured daily routines. Furthermore, unmarried men are associated with daily routine, whereas non-single identities incorporate some family-oriented terms.
- **Child-Based Observations:** Women with children commonly feature *chore*, reinforcing household labor expectations. Muslim males with many children highlight *father*, reinforcing a paternal role, while Hindu males maintain a more routine narrative with *day* and *chore*.
- The lack of diverse vocabulary, with repeated words like *daily*, suggests that Punjabi generations are constrained by low-resource limitations (Singh et al., 2024), leading to high similarity with prompt tokens.

G.27 Top Bias Terms for Marathi - Story

To analyze the highest bias terms from our bias lexicon in Marathi story generations from the original prompting method, we highlight all 48 identities and associated bias scores in Table 31. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.27.1 Analysis of Gender and Religion

- **Hindu Female:** The identities with the highest bias scores are associated with *house* and *home*, which appear consistently across marital statuses. The highest bias values (0.071 for married with no children) are seen frequently associated with the term *home*, suggesting that **Hindu women are stereotypically associated with domestic roles, regardless of their marital or parental status.** Terms like *happy* and *house* appear in the married and widowed categories, indicating a strong bias towards these traditional roles. **This aligns with societal expectations of women as homemakers and caretakers.** The bias scores for Hindu females vary reach up to 0.071, with the highest bias observed in married and divorced categories, reflecting a societal expectation for married women to take on household care.
- **Hindu Male:** For Hindu males, terms like *car* and *back* suggest vehicle maintenance expectations, and withdrawal from societal expectations. These terms reflect the stereotype of males as independent and active, especially in the context of single males. **The bias scores for Hindu males are generally low, reaching up to 0.043, showing a less significant bias compared to females.** Widowed and divorced Hindu males are associated somewhat with *engagement*, *fight*, and *back*, indicating themes of conflict and withdrawal.
- **Muslim Female:** For Muslim females, terms such as *house* and *home* are prominent, with bias scores reaching up to 0.068. These terms are associated with traditional domestic roles, similar to the biases seen for Hindu females. *Happy* is prevalent for married individuals, showing ideas of satisfaction for those who meet community marital expectations. **The bias scores for Muslim females range from 0.025 to 0.068, which indicates a slightly lower level of bias compared to Hindu females.**
- **Muslim Male:** Muslim males are often associated with terms like *lonely*, *fight*, and *wrong*, with relatively low bias scores. This suggests that Muslim males are seen as incomplete or violent. The bias scores for Muslim males are slightly lower to those for Hindu males, ranging from 0.006 to 0.027, **showing that there**

is a lower bias associated with this identity than other identities.

G.27.2 Marital Status-Based Analysis

- **Single:** For both Hindu and Muslim males and females, the bias associated with being single is moderate, with terms like *car* (0.003) and *back* (0.003) in Hindu males and *lonely* (0.005) in Muslim males. **These terms reflect stereotypes of independence, loneliness, or falling behind in society.** However, single females face a higher degree of societal pressure, with Hindu and Muslim females both associated with *house* and *home* with Bias TF-IDF values between 0.009 and 0.011, reinforcing the stereotype that **women are expected to take on domestic roles regardless of marital status. The bias scores for single individuals are generally lower, with Muslim males exhibiting the lowest scores.**
- **Married:** Married individuals, particularly Hindu and Muslim females, exhibit the highest bias scores, with terms such as *home*, *happy*, and *love* dominating their respective bias profiles. **This aligns with societal expectations of marriage and family care as essential to a woman's identity.** For Hindu and Muslim males, the bias is much less pronounced, with *happy* and *love* appearing but at much lower TF-IDF values, **suggesting lower pressure for men to conform to specific marital expectations.**
- **Divorced:** Divorced individuals, particularly females with one child, experience a bias with terms like *house* and *home* remaining prominent. The Bias TF-IDF values for divorced females with one child are relatively high, **indicating that divorced women are often viewed in terms of domestic roles, even if their marital status is nontraditional.** Male divorced individuals, however, show very low bias scores, with terms like *engagement* and *fight* appearing at low TF-IDF values, **reflecting stereotypes of conflict and aggression.**
- **Widowed:** Widowed individuals, especially females, are still subject to domestic biases, with moderate bias scores. The bias for widowed males is very lower, with terms like *fire* and *back* indicating destruction and falling behind in society's expectations, **although this**

Table 31: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Story** in Marathi outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.031	house	0.011
		One child	0.033	home	0.009
		Many children	0.037	home	0.011
	Married	No children	0.071	home	0.020
		One child	0.049	house	0.010
		Many children	0.064	happy	0.012
	Divorced	No children	0.030	house	0.008
		One child	0.053	home	0.018
		Many children	0.026	house	0.007
	Widowed	No children	0.034	home	0.009
		One child	0.023	home	0.011
		Many children	0.044	house	0.018
Hindu Male	Single	No children	0.011	car	0.003
		One child	0.010	back	0.003
		Many children	0.015	offer	0.002
	Married	No children	0.025	love	0.010
		One child	0.043	happy	0.015
		Many children	0.038	happy	0.013
	Divorced	No children	0.006	engagement	0.002
		One child	0.013	back	0.003
		Many children	0.010	fight	0.003
	Widowed	No children	0.007	fire	0.002
		One child	0.010	back	0.003
		Many children	0.006	back	0.002
Muslim Female	Single	No children	0.026	house	0.011
		One child	0.039	home	0.009
		Many children	0.030	home	0.009
	Married	No children	0.068	home	0.021
		One child	0.056	happy	0.009
		Many children	0.057	happy	0.010
	Divorced	No children	0.029	home	0.009
		One child	0.054	house	0.017
		Many children	0.039	house	0.009
	Widowed	No children	0.025	home	0.007
		One child	0.025	home	0.011
		Many children	0.037	house	0.015
Muslim Male	Single	No children	0.014	lonely	0.005
		One child	0.011	attack	0.002
		Many children	0.009	repair	0.002
	Married	No children	0.025	wrong	0.007
		One child	0.027	happy	0.014
		Many children	0.025	love	0.006
	Divorced	No children	0.010	fight	0.003
		One child	0.017	fight	0.005
		Many children	0.011	fight	0.002
	Widowed	No children	0.005	positive	0.001
		One child	0.005	agency	0.002
		Many children	0.011	allow	0.002

association is not as strong as the expectations for women to focus on domestic work.

G.27.3 Number of Children-Based Analysis

- **No children:** Married females with no children face the highest bias scores, indicating a strong emphasis on family roles. In contrast, males, both Hindu and Muslim, experience less bias, with terms like *car* and *positive* appearing. However, the term *wrong* (0.007) appears for **married Muslim males without children, indicating a fault in not having children after marriage. Yet, the bias score is moderate, indicating the expectation is not very extreme.**
- **One child:** The bias for individuals with one

child is relatively moderate. For Hindu and Muslim females, terms like *home* and *happy* reflect a bias towards viewing these individuals in traditional roles. **Divorced women with one child have high bias scores, indicating small family size post-divorce leads to stereotyping. Males are frequently associated with fighting, although this association is relatively low.**

- **Many children:** The highest bias for individuals with many children is seen in the married categories, with terms like *happy*, *home*, and *love* appearing. The bias is stronger for Hindu and Muslim females, as individuals are often stereotypically associated with being nurturing, stable, and fulfilling traditional

societal roles, **leading to higher bias scores compared to those with fewer or no children**. These terms appear for Hindu and Muslim males, with lower TF-IDF values.

G.27.4 Summary of Findings

- **Religion and Gender:** Hindu females face the highest bias, particularly linked to traditional roles such as homemaking and caregiving, with terms like *house* and *home* consistently appearing across marital statuses and number of children. Muslim females exhibit similar biases but with slightly lower scores. In contrast, Hindu and Muslim males face significantly less bias.
- **Marital Status:** Married individuals, especially females, face the highest bias, with traditional family roles expected of them. Males, regardless of marital status, face much lower bias, reflecting societal expectations that place less pressure on men to fulfill traditional family roles. Divorced Muslim and Hindu males are often associated with more aggressive terms like *fight*, indicating stereotypes of aggression and conflict.
- **Children:** Individuals with many children, particularly females, face high bias tied to societal expectations of nurturing and family stability. Males experience less bias related to their parental status.

G.28 Top Bias Terms for Marathi - Hobbies and Values

To analyze the highest bias terms from our bias lexicon in Marathi generations of hobbies and values from the original prompting method, we highlight all 48 identities and associated bias scores in Table 32. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.28.1 Analysis of Gender and Religion

- **Hindu Female:** The highest Bias TF-IDF terms for Hindu females include *cook*, *housewife*, and *family*. These terms appear frequently across marital statuses, with *cook* being the most common term across all marital statuses. For married women with many children, *family* dominates with a bias score of 0.151 and a TF-IDF value of 0.032, **reinforcing the expectation that women with children should focus on family life**.
- **Hindu Male:** The bias terms for Hindu males are primarily focused on independence and responsibility. *Independent* and *love* are prominent, with bias scores reaching 0.043 for married males. The bias score for Hindu males is lower compared to Hindu females, ranging from 0.000 to 0.043, suggesting less bias against them in the context of hobbies and values. **This aligns with the societal stereotype of men being less bound by societal expectations in marriage and child-rearing**. Single males are described as *independent* and married males with *love*, showing autonomy before marriage, tied with satisfaction after marriage.
- **Muslim Female:** For Muslim females, the most common bias terms are *traditional*, *cook*, *home*, and *love*. *Cook* appears frequently across divorced and widowed statuses, **indicating a moderate bias towards domestic roles, albeit somewhat lower than for Hindu females**. Married women are more tied to domestic work, with the highest bias scores reaching 0.123. Terms like *traditional* (TF-IDF value of 0.011) **reflect the stereotype of Muslim women being more conservative and tied to home-based duties**.
- **Muslim Male:** Muslim males are primarily associated with terms like *responsibility*, *provide*, and *happiness*, reflecting the stereotype of **men as providers and independent figures who have freedom in their choices**. The bias scores ranging from 0.006 to 0.037. **Muslim males show some lower levels of bias across identities, whereas Hindu males sometimes have no bias detected**.

Table 32: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Hobbies and Values** in Marathi outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.088	cook	0.019
		One child	0.104	cook	0.020
		Many children	0.107	cook	0.018
	Married	No children	0.075	love	0.017
		One child	0.127	housewife	0.025
		Many children	0.151	family	0.032
	Divorced	No children	0.040	cook	0.014
		One child	0.087	cook	0.022
		Many children	0.059	family	0.017
	Widowed	No children	0.079	cook	0.029
		One child	0.051	cook	0.017
		Many children	0.082	family	0.026
Hindu Male	Single	No children	0.021	poor	0.010
		One child	0.024	independent	0.011
		Many children	0.039	independent	0.011
	Married	No children	0.037	love	0.012
		One child	0.043	love	0.032
		Many children	0.040	love	0.028
	Divorced	No children	0.009	restrain	0.009
		One child	0.013	confidence	0.007
		Many children	0.000	N/A	N/A
	Widowed	No children	0.010	strong	0.005
		One child	0.006	provide	0.006
		Many children	0.000	N/A	N/A
Muslim Female	Single	No children	0.061	traditional	0.011
		One child	0.057	freedom	0.012
		Many children	0.060	household	0.016
	Married	No children	0.056	love	0.018
		One child	0.091	home	0.012
		Many children	0.123	love	0.036
	Divorced	No children	0.067	cook	0.012
		One child	0.045	care	0.008
		Many children	0.048	family	0.014
	Widowed	No children	0.050	cook	0.016
		One child	0.059	cook	0.023
		Many children	0.033	family	0.013
Muslim Male	Single	No children	0.025	independent	0.021
		One child	0.036	responsibility	0.013
		Many children	0.014	freedom	0.009
	Married	No children	0.028	love	0.010
		One child	0.032	happiness	0.009
		Many children	0.037	love	0.023
	Divorced	No children	0.015	strong	0.010
		One child	0.029	limit	0.009
		Many children	0.007	provide	0.004
	Widowed	No children	0.007	aim	0.007
		One child	0.007	breadwinner	0.007
		Many children	0.006	leader	0.006

G.28.2 Marital Status-Based Analysis

- **Single:** Single males are more likely to be associated with terms like *independent*. However, single women are associated with *traditional*, *cook*, and *household*, suggesting **societal expectations of women remain tied to domestic tasks even while single**. Interestingly, single Muslim women with no children are associated with *traditional* with a moderate bias score of 0.061, **implying single women without children are seen as conventional or conservative**. Single males are seen as autonomous, however, Hindu single males with no children are associated with *poor*, demonstrating pity.
- **Married:** Married individuals across both

genders and religions are frequently associated with *love* and *family*, **reflecting societal expectations around love, marriage, and family life**. For Hindu women, the term *housewife* appears with a TF-IDF value of 0.025, reinforcing traditional gender roles. **Married Muslim women show higher TF-IDF values for *love* (up to 0.036), reflecting the cultural emphasis on family ties**.

- **Divorced:** Divorced individuals face high bias, particularly for Hindu women, where terms like *cook* and *family* **reflect stereotypes about maintaining feminine roles**. For males, the term *restrain* appears with a TF-IDF value of 0.009, reflecting **societal discomfort with divorced men breaking from**

traditional family norms. Divorced Muslim males are associated with *limit* and *strong*, **showing resilience and control.**

- **Widowed:** Widowed individuals, especially women, are associated with terms like *cook* and *family*, again reflecting an emphasis on traditional domestic roles. However, widowed men are less likely to face such strong biases, with terms like *strong* and *provide* being more common for them, indicating a slight bias toward viewing widowed men as more resilient or capable.

G.28.3 Number of Children-Based Analysis

- **No Children:** Males without children tend to be associated with terms like *independent* and *poor* (for Single Hindu males). This demonstrates **an association with autonomy and pity** in some cases for those that are unmarried. Hindu women in this category are associated with *cook*, showing a **traditional expectation tied to domestic duties**. For Muslim women, *traditional* and *freedom* appear more frequently, **indicating a bias toward the expectation that Muslim women remain within conventional roles.**
- **One Child:** For individuals with one child, there is a slight increase in the bias towards terms like *housewife* for Hindu women and *cook* for women overall. Hindu women with one child show a bias for *housewife* (TF-IDF value of 0.025), **reflecting the view that women with children should focus on domestic roles.** Similarly, Muslim women with one child are associated with terms like *home*, indicating societal pressure to focus on family values. Muslim and Hindu males show similar bias scores to those with many children, indicating small or big family sizes do not contribute excessively to bias scores for males.
- **Many Children:** Individuals with many children show the highest bias, particularly Hindu women, who are associated with terms like *family* and *housewife* (TF-IDF values up to 0.032). For Muslim women, the bias is similarly high, with *love* and *family* reflecting the expectation of a strong family-oriented identity. These terms highlight the **societal expectation for individuals, particularly women,**

to prioritize family life when they have children. Males with many children have relatively low bias scores, indicating less bias for those with children.

G.28.4 Summary of Findings

- The overall bias scores for Hindu women are higher than those for Hindu men, with terms like *cook*, *housewife*, and *family* reflecting strong societal expectations for women to be tied to domestic and nurturing roles. For males, the terms are less biased, with a focus on *independent*, *provide*, and *responsibility*, highlighting the less restrictive societal expectations for men.
- Muslim women also face significant bias, although their bias scores are generally lower than Hindu women, with terms like *traditional* and *cook* being prevalent. Hindu males, however, face the lowest bias scores, aligning them facing less scrutiny.
- The marital status analysis shows that widowed and divorced individuals, particularly men, face less bias compared to those who are married or single. For women, there is a clear societal preference for marriage and family roles, with bias terms like *housewife*, *family*, and *cook* dominating, especially for married women.
- Regarding the number of children, individuals with many children show the strongest bias, with terms like *family* and *love*, especially for married individuals. This reinforces the societal expectation that having children, especially many children, solidifies one's role in the family and the household.

G.29 Top Bias Terms for Marathi - To-do List

To analyze the highest bias terms from our bias lexicon in Marathi generations of daily activities from the original prompting method, we highlight all 48 identities and associated bias scores in Table 33. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.29.1 Analysis of Gender and Religion

- **Hindu Female:** The bias scores are high for Hindu females, with highest Bias TF-IDF terms including *chore* and *household*, and *housewife*. Bias scores reach 0.607 for married women with many children. **This suggests a strong societal expectation of Hindu women being associated with household chores, particularly in the context of marriage and children.** The term *housewife* is also prominent, with TF-IDF values up to 0.201, reinforcing traditional gender roles that place Hindu women in domestic roles. The bias scores for Hindu females are high, with a more intense bias for married and widowed women.
- **Hindu Male:** For Hindu males, the terms *maintenance* and *responsibility* are the most frequent, reflecting societal expectations of independence and self-sufficiency. Male bias scores are notably lower than those for females, ranging from 0.000 to 0.036. **Hindu males have low to no bias scores in the generation of daily activities compared to other identities bias scores.**
- **Muslim Female:** For Muslim females, the terms *chore* consistently appears as the most frequent term across identities, , reflecting a bias towards associating Muslim women with domestic responsibilities. Similar to Hindu females, Muslim women are expected to engage in household tasks, with their bias scores reaching up to 0.409. **This indicates that, while the bias is slightly less pronounced than for Hindu females, societal expectations of Muslim women in traditional roles persist.**
- **Muslim Male:** For Muslim males, the term *offer* appears regularly, suggesting a **bias towards the traditional role of men as providers.** Their bias scores range from 0.004 to 0.111, which are **higher bias scores than those of Hindu males.** This reflects the stereotype of Muslim men being expected to provide for their families, a stereotype that is more pronounced than the expectations placed on Hindu males.

G.29.2 Marital Status-Based Analysis

- **Single:** For both Hindu and Muslim females, the term *chore* is the most frequent with moderate TF-IDF values. This indicates that **even unmarried women are often linked to domestic responsibilities.** However, Hindu males show very low bias scores with corresponding frequent terms of *offer* and *maintenance*, which is in line with the **societal stereotype that single men are expected to focus on providing.**
- **Married:** Married females, both Hindu and Muslim, exhibit higher bias scores compared to their single counterparts, with terms focusing on households and chores. This highlights the societal expectation that **married women are tied to domestic duties.** Married Hindu males sometimes have higher bias scores than single Hindu males, however, married Hindu males show a frequent association with *responsibility*. **This indicates males are considered more responsible after marriage.** Muslim males are associated with *offer* and *kind*, showing positive sentiments and expectations of providing for their families.
- **Divorced:** Divorced Hindu females show a **bias towards terms like *chore*, with a more pronounced bias for those without children as seen by a high bias score of 0.504.** Muslim females also show a similar trend of emphasizing *chore*. However, divorced males from both religious groups show significantly lower bias values, with terms like *offer* or *responsibility* appearing minimally, indicating that **divorced males are expected to consider their families and take on any costs, however, the expectations upon men are less apparent than those on women.** Divorced Hindu males with no children are associated the most with *limit*, showing themes of restraint.
- **Widowed:** Widowed females, especially Hindu females, frequently show bias towards terms like *household* and *chore*, again **reinforcing the expectation that widowed women are primarily engaged in domestic work.** Widowed males show even lower bias scores, with top terms like *maintenance* and *offer*.

Table 33: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **To-do List** in Marathi outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.379	chore	0.108
		One child	0.418	household	0.127
		Many children	0.339	chore	0.104
	Married	No children	0.468	household	0.141
		One child	0.588	housewife	0.173
		Many children	0.607	housewife	0.201
	Divorced	No children	0.504	chore	0.172
		One child	0.378	chore	0.102
		Many children	0.372	chore	0.097
	Widowed	No children	0.440	household	0.160
		One child	0.552	chore	0.175
		Many children	0.380	chore	0.104
Hindu Male	Single	No children	0.018	maintenance	0.009
		One child	0.000	N/A	N/A
		Many children	0.029	maintenance	0.020
	Married	No children	0.032	maintenance	0.025
		One child	0.025	responsibility	0.015
		Many children	0.000	N/A	N/A
	Divorced	No children	0.015	limit	0.009
		One child	0.016	responsibility	0.016
		Many children	0.036	responsibility	0.013
	Widowed	No children	0.000	N/A	N/A
		One child	0.027	maintenance	0.027
		Many children	0.011	maintenance	0.011
Muslim Female	Single	No children	0.350	chore	0.099
		One child	0.305	chore	0.100
		Many children	0.345	chore	0.088
	Married	No children	0.371	chore	0.108
		One child	0.315	chore	0.076
		Many children	0.409	chore	0.116
	Divorced	No children	0.373	chore	0.114
		One child	0.287	chore	0.073
		Many children	0.288	chore	0.072
	Widowed	No children	0.350	chore	0.104
		One child	0.294	chore	0.084
		Many children	0.304	chore	0.098
Muslim Male	Single	No children	0.069	offer	0.063
		One child	0.110	offer	0.081
		Many children	0.043	offer	0.038
	Married	No children	0.111	offer	0.049
		One child	0.081	offer	0.053
		Many children	0.004	kind	0.004
	Divorced	No children	0.084	offer	0.059
		One child	0.046	offer	0.046
		Many children	0.035	offer	0.029
	Widowed	No children	0.046	offer	0.046
		One child	0.029	offer	0.022
		Many children	0.066	offer	0.024

G.29.3 Number of Children-Based Analysis

- **No Children:** For females, both Hindu and Muslim, the terms *chore* and *household* dominate. This suggests a stereotype that **even childless women are expected to perform domestic chores**. For males, both Hindu and Muslim, **bias scores and terms are less pronounced, showing minimal association with maintaining and providing for their homes**.
- **One Child:** The bias scores for Hindu females increases with the predominate term *housewife*, indicating that **women with one child are more strongly associated with domestic roles**. Muslim females also show a bias towards *chore*. For males, the bias is sig-

nificantly lower, with terms like *responsibility* appearing at lower values, **indicating minimal bias towards male parental responsibilities**.

- **Many Children:** Females with many children, particularly Hindu females, have the highest bias scores, with terms like *housewife*, *household*, and *chore* showing relatively high Bias TF-IDF values. This reflects the societal expectation for women, particularly those with many children, to be primarily focused on domestic duties. For males, the bias remains low, **reinforcing the stereotype that men are expected to maintain their more external and independent roles**.

G.29.4 Summary of Findings

- **Gender-Based Bias:** Female identities, especially Hindu and Muslim women, show consistently higher bias scores than their male counterparts across all categories. The most frequently mentioned bias terms for women are *chore*, *household*, and *housewife*, reflecting societal expectations of women being tied to domestic responsibilities. In contrast, male bias terms focus mostly on maintenance and providing for their families, with much lower TF-IDF values.
- **Religion-Based Bias:** There is a slight difference between Hindu and Muslim females, with Hindu females generally exhibiting stronger biases tied to traditional household roles. Muslim males, on the other hand, show a stronger association with the stereotype of men as providers (*offer*) compared to Hindu males. Hindu females are associated mostly with *responsibility* and *maintenance*.
- **Marital Status-Based Bias:** Married and widowed females consistently show higher bias scores, particularly tied to domestic roles, while single and divorced females show lower bias values. Males, regardless of marital status, show minimal bias associated with domestic responsibilities.
- **Children-Based Bias:** The number of children strongly influences the bias scores for females, with higher bias scores appearing for those with more children. The terms *housewife*, *chore*, and *household* are more prominent for women with children, indicating the societal expectation that women with children are predominantly focused on the household. For men, there is minimal bias associated with the number of children, reinforcing that men are expected to provide responsibly, although less stringent expectations are placed on them.

G.30 Top Overall Terms for Marathi - Story

To analyze the most frequent terms from the applications and 48 identities Marathi generations of stories under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 34. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.30.1 Analysis of Gender and Religion

- **Hindu Female:** The most frequent terms for Hindu females include *two* (TF-IDF up to 0.047), *work* (up to 0.036), *several* (0.044), and *marry* (up to 0.058). The term *two*, similar to *several*, appears frequently across various marital statuses and may imply references to relationships or dual roles. The association with *work* reflects some level of independence, with work being an important term across most marital statuses except divorced. Divorced Hindu women show the frequent term *marry*, **showing an emphasis on their previous marriage or remarriage.**
- **Hindu Male:** For Hindu males, *wife* (up to 0.069), *two* (up to 0.056), *son* (0.044), and *teacher* (0.042) appear frequently. *Wife* dominates across all marital statuses, emphasizing the **traditional view where marriage is expected, and men are often associated with marriage and family.** The presence of *two* reflects duality or relationships. *Teacher* and *son* are also common terms, demonstrating career and family-oriented terminology.
- **Muslim Female:** For Muslim females, terms like *go* (0.041), *several* (0.037), *two* (0.042), and *husband* (up to 0.034), *marry* (0.041) are common. *Go*, which may reflect the more traditional roles assigned to women in Muslim contexts such as **leaving the house** for household-related duties, going out for family obligations, or engaging in activities deemed appropriate for women in certain cultural settings. *Marry* appearing for divorced women, similar to trends found for Hindu women, shows the **association of divorced women with marriage or remarriage.** The term *work* (0.029) does not dominate as much as for Hindu females, **showing a contrast in the portrayal of women in both religious contexts.** Phrases like *husband* are common in married and divorced categories, **showing a dependence on relationship with males. Several and two may show connections to duality or relationships, and these terms are consistent across all identities.**
- **Muslim Male:** The most frequent terms for Muslim males are *wife* (up to 0.053), *two* (up to 0.051), and *teacher* (0.043). Similar to Hindu males, *wife* appears as a sig-

Table 34: Highest Overall TF-IDF terms and values for all identities under the application **Story** in Marathi outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	two	0.047
		One child	work	0.031
		Many children	several	0.044
	Married	No children	one	0.041
		One child	son	0.044
		Many children	work	0.035
	Divorced	No children	marry	0.058
		One child	marry	0.036
		Many children	two	0.035
	Widowed	No children	work	0.036
		One child	mother	0.031
		Many children	two	0.032
Hindu Male	Single	No children	two	0.056
		One child	wife	0.053
		Many children	go	0.037
	Married	No children	wife	0.054
		One child	two	0.037
		Many children	two	0.048
	Divorced	No children	wife	0.069
		One child	son	0.044
		Many children	teacher	0.042
	Widowed	No children	wife	0.048
		One child	wife	0.059
		Many children	two	0.041
Muslim Female	Single	No children	go	0.041
		One child	work	0.029
		Many children	several	0.037
	Married	No children	husband	0.034
		One child	say	0.035
		Many children	woman	0.034
	Divorced	No children	marry	0.041
		One child	husband	0.031
		Many children	two	0.042
	Widowed	No children	work	0.038
		One child	mother	0.028
		Many children	one	0.033
Muslim Male	Single	No children	go	0.041
		One child	day	0.037
		Many children	several	0.038
	Married	No children	wife	0.049
		One child	two	0.051
		Many children	wife	0.041
	Divorced	No children	wife	0.053
		One child	wife	0.044
		Many children	teacher	0.043
	Widowed	No children	wife	0.044
		One child	wife	0.039
		Many children	two	0.034

nificant term across marital statuses, but this association is stronger in Hindu males. The prominence of *two* stands out, possibly highlighting dual roles, family size, or even polygamous practices, which are more culturally associated with Muslim identity.

G.30.2 Marital Status-Based Analysis

- **Single:** Both single Hindu females and males frequently feature *two*, highlighting the duality of relationships or choices within their respective contexts. For Muslim females, the term *go* (0.041) is prominent, indicating an emphasis on independent action.
- **Married:** For married individuals, the term *wife* dominates for both Hindu males (0.054)

and Muslim males (0.049). This suggests that marriage is a central theme in the stories of married men. For women, *son* (0.044 for Hindu females) and *say* (0.035 for Muslim females) appear most prominently. This shows a focus on children for Hindu females, and a focus on expression for Muslim females.

- **Divorced/Widowed:** Divorced and widowed women often feature *marry*, signifying the societal expectations towards marriage. For widowed men, *wife* is often mentioned, emphasizing the significance of the spousal relationship even in widowhood.

G.30.3 Children-Based Analysis

- **No Children:** Terms like *two*, *husband*, and *wife* appear frequently across all identities, emphasizing spousal relationships. Hindu females do not typically express *husband* as a top term, indicating less dependence on a male partner.
- **One Child:** For those with one child, the term *marry* (0.058 for Hindu females) stands out, suggesting narratives of marriage and family formation. The presence of *husband* (0.031 for Muslim females), *son* (0.044 for Hindu males), and *two* (up to 0.051 for Muslim males) **emphasizes the family-oriented nature of the storytelling and duality in relationships**. Widowed women with one child are often associated with *mother*, demonstrating narratives related to maternal duties.
- **Many Children:** The presence of many children prominently features terms like *several* and *two* across all identities, further reflecting the idea of family size and structure.

G.30.4 Summary of Findings

- *Work* is associated with single females, demonstrating a focus on responsibilities in stories. Females are also linked to *mother* and *husband*, whereas males are associated with *wife*, emphasizing relationships in story generations. Hindu males show a stronger emphasis on *wife*.
- *Two* and *several* is common across all identities, showing numerical descriptions of dual roles or relationships. *Two* in the context of Muslim males may indicate polygamous relationships.
- Divorced women are associated with *marry*, showing society's expectations towards marriage and maintaining a marriage.
- Marital status influences term frequency, with married individuals frequently associated with *wife*, while single individuals often feature *two*, potentially reflecting social expectations around relationships. Divorced and widowed individuals, particularly women, show strong associations with *marry*, *work*, and *house*, suggesting a shift in focus toward financial independence and household responsibilities.

- The number of children impacts the prominence of certain terms. Widowed women with one child are associated with *mother* and Hindu married women with one child are associated with *son*, reinforcing maternal roles. For men, terms like *wife* remain central, suggesting a continued emphasis on spousal identities.

G.31 Top Overall Terms for Marathi - Hobbies and Values

To analyze the most frequent terms from the applications and 48 identities Marathi generations of hobbies and values under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 35. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.31.1 Analysis of Gender and Religion

- **Hindu Female:** The most prominent terms for Hindu females include *woman* (TF-IDF up to 0.082), *mother* (0.064 for one child), and *housewife* (0.060 for many children). These terms reflect traditional gender roles, with *housewife* and *mother* **aligning with societal expectations of women as primary caregivers and homemakers**. The term *woman* is consistently prominent, **emphasizing the centrality of gender identity in the generations**.
- **Hindu Male:** Hindu males feature terms like *music* (up to 0.086) and *man* (up to 0.073), and *father* (0.071) emphasizing individualistic interests and broader social roles. The term *man* appears consistently across statuses, **indicating strong identification with masculine roles**. The frequency of *man* in relation to *father* (0.071) for married men with children **suggests the emphasis on fatherhood as a key role for Hindu males**.
- **Muslim Female:** Muslim females frequently exhibit terms like *woman* (up to 0.136). However, the term *woman* gains increased prominence for those with many children, reflecting a stronger maternal emphasis. The repetition of *woman* across statuses suggests a narrative centered on gender identity and caregiving roles. **Muslim females tend to show higher TF-IDF values for *woman*, reflecting stronger maternal emphasis compared to their Hindu counterparts**.
- **Muslim Male:** The term *man* (up to 0.247) appears frequently across statuses, with high TF-IDF values. Muslim males have a stronger connection to patriarchal roles, with terms such as *man* consistently dominating. Additionally, terms like *parent* (0.069 for one child) reflect broader familial responsibilities, though *man* remains central across contexts. Additionally, *man* is more pronounced for Muslim males than Hindu males, indicating a stronger connection to masculinity for Muslim males.
- The higher TF-IDF value of *man* and *woman* for Muslim identities may point to stronger adherence to traditional gender roles within

Muslim narratives compared to Hindu narratives.

G.31.2 Marital Status-Based Analysis

- **Single:** Single women are associated with *woman*, while Hindu women have broader terms like *mother* and *housewife*, **indicating more domestic emphasis on Hindu women**. Muslim males are **associated with masculinity**, seen by the repetition of the term *man*. Hindu males are associated primarily with *music*, showing **individualistic interests**.
- **Married:** Married women are continually described with *woman*, and this association is stronger for Muslim women. Hindu women with no children are associated with *passion*, showing they are described as more emotional. Muslim males are described with *man*, and Hindu males as well, yet Hindu males have terms like *father* appearing. Hindu males are slightly more associated with their children than Muslim males.
- **Divorced/Widowed:** Muslim and Hindu females are associated moderately with *woman*. Similarly, Muslim males are associated with *man*, with varying TF-IDF values. Hindu males are described with *man* and *music*, reflecting individual interests in widowhood.

G.31.3 Number of Children-Based Analysis

- **No Children:** Terms like *passion* (for Hindu females) and *music* (for Hindu males) appear, indicating Hindu identities have more individualistic interests in the absence of children. Muslim males and females are associated with their respective gender identities.
- **One Child:** For identities except Muslim females, there are terms like *alone*, *single*, and *parent*, occurring frequently. This means having single children is described with isolation and parental relationships.
- **Many Children:** For women with many children, the terms *housewife* and *woman* dominate. These terms strongly **reinforce traditional maternal and domestic roles**. The high TF-IDF values for *woman* in **Muslim females with many children suggest a more pronounced maternal identity**. Muslim males with many children have higher TF-IDF values for *man*, **implying parenthood**

Table 35: Highest Overall TF-IDF terms and values for all identities under the application **Hobbies and Values** in Marathi outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	woman	0.082
		One child	mother	0.064
		Many children	housewife	0.060
	Married	No children	passion	0.052
		One child	woman	0.047
		Many children	woman	0.063
	Divorced	No children	woman	0.073
		One child	alone	0.049
		Many children	want	0.060
	Widowed	No children	woman	0.065
		One child	single	0.055
		Many children	woman	0.065

		One child	woman	0.091
		Many children	woman	0.135
	Married	No children	woman	0.127
		One child	woman	0.115
		Many children	woman	0.136
	Divorced	No children	woman	0.096
		One child	woman	0.106
		Many children	woman	0.113
	Widowed	No children	woman	0.117
		One child	woman	0.099
		Many children	woman	0.101
Muslim Male	Single	No children	man	0.104
		One child	parent	0.069
		Many children	man	0.110
	Married	No children	man	0.069
		One child	man	0.113
		Many children	man	0.247
	Divorced	No children	man	0.079
		One child	man	0.089
		Many children	man	0.125
	Widowed	No children	man	0.103
		One child	man	0.094
		Many children	man	0.145

is a defining feature of their identity and masculinity.

G.31.4 Summary of Findings

- Gendered patterns are evident, with women frequently associated with domestic and maternal terms like *woman* and *housewife*, whereas men are more often linked to terms like *man* and *father*.
- Muslim men exhibit a stronger connection to masculinity, especially when they have many children, as indicated by the higher TF-IDF values for *man*. Similarly, Muslim married women have strong associations with femininity when they are single or married, especially with children.

- Having one child commonly generates the term *single* and *alone*, demonstrating isolation.

G.32 Top Overall Terms for Marathi - To-do List

To analyze the most frequent terms from the applications and 48 identities Marathi generations of daily activities under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 36. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.32.1 Analysis of Gender and Religion

- **Hindu Female:** The terms for Hindu females frequently include *cooking*, *chore*, and *housework*, with TF-IDF values ranging from 0.120 to 0.209. The higher values, particularly for terms like *housewife* and *chore*, **reflect traditional gender roles associated with women being expected to manage domestic responsibilities, especially when married or widowed.**
- **Hindu Male:** Hindu males, regardless of marital status, are often associated with terms like *chore*, *housework*, and *home*, with moderate to low TF-IDF values. These values suggest that **even though men are expected to contribute to household work, there is a less pronounced focus on domestic roles compared to women.** Notably, the presence of terms like *every* and *home* among single men and terms like *chore* among divorced or widowed men **suggests a more general role for men within the household.**
- **Muslim Female:** Muslim females exhibit terms such as *cooking*, *housework*, and *chore*, with TF-IDF values reaching 0.177. The consistency in these terms suggests a similar emphasis on domestic roles as seen in Hindu women, with a slight variation in the types of household work depending on the number of children. **The TF-IDF values for these terms are lower than those for Hindu females.**
- **Muslim Male:** Muslim males, similar to Hindu males, frequently feature terms like *chore*, with greater emphasis on terms like *Namaz*, reflecting religious and cultural practices. The prevalence of *Namaz* across marital statuses indicates the importance of religious observance in Muslim male identity, **further cementing the notion of Muslim men being perceived as more traditional.** Furthermore, The strong association of *Namaz* with Muslim males, particularly among those with no children, reinforces the stereotype of Muslim men as being strongly tied to religious observance, **which contrasts with Hindu males who show a less dominant association with religious terms in daily activities.**

G.32.2 Marital Status-Based Analysis

- **Single:** For Hindu and Muslim females, the term *cooking* features prominently, emphasizing the **domestic role expected of women, even when single.** Hindu and Muslim single men, on the other hand, are associated with terms like *chore*, indicating an **emphasis on some household responsibilities.** This reflects societal expectations for men to be responsible.
- **Married:** Married Hindu women are frequently associated with terms like *chore*, *housewife*, and *cooking*, emphasizing their role in managing the home. Hindu males are associated with *chore* and *housework*, underscoring the traditional expectation of men caring and providing for their home. Muslim males and females are highly associated with *Namaz*.
- **Divorced/Widowed:** Both divorced and widowed Hindu women have terms like *housework* and *chore* **reflecting traditional domestic roles.** Hindu widowed and divorced men also retain the emphasis on domestic terms like *housework* but appear less associated with domestic terms especially after divorce, **indicating a shift in responsibilities after divorce or widowhood.** Muslim males are more associated with *Namaz* than when single or married, **indicating a dependence on prayer in times of spousal loss.**

G.32.3 Children-Based Analysis

- **No Children:** Across female and Hindu male identities, the term *chore* is prevalent. However, the term frequencies are higher for women, **highlighting the traditional expectation for women to focus on domestic roles instead of men.** For Muslim males, *Namaz* appears prominently, showing a cultural emphasis on spirituality. There are higher associations with *Namaz* when there are no children, **suggesting that having fewer family obligations allows more time to be designated for religious prayers.**
- **One Child:** The domestic expectations are usually more stringent on those with children, especially one child. The presence of a child sometimes increases the prominence of terms related to domestic chores for both genders.

Table 36: Highest Overall TF-IDF terms and values for all identities under the application **To-do List** in Marathi outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	cooking	0.161
		One child	cooking	0.174
		Many children	housework	0.173
	Married	No children	chore	0.166
		One child	chore	0.153
		Many children	housewife	0.197
	Divorced	No children	chore	0.190
		One child	chore	0.120
		Many children	housework	0.131
	Widowed	No children	household	0.178
		One child	chore	0.209
		Many children	housework	0.140
Hindu Male	Single	No children	chore	0.148
		One child	every	0.097
		Many children	home	0.088
	Married	No children	housework	0.109
		One child	chore	0.131
		Many children	chore	0.131
	Divorced	No children	chore	0.137
		One child	housework	0.080
		Many children	housework	0.085
	Widowed	No children	chore	0.136
		One child	chore	0.112
		Many children	chore	0.118
Muslim Female	Single	No children	cooking	0.177
		One child	housework	0.145
		Many children	cooking	0.125
	Married	No children	cooking	0.176
		One child	chore	0.102
		Many children	chore	0.155
	Divorced	No children	chore	0.148
		One child	chore	0.101
		Many children	housework	0.113
	Widowed	No children	chore	0.138
		One child	cooking	0.146
		Many children	chore	0.149
Muslim Male	Single	No children	namaz	0.210
		One child	namaz	0.195
		Many children	chore	0.074
	Married	No children	namaz	0.197
		One child	namaz	0.138
		Many children	man	0.083
	Divorced	No children	namaz	0.299
		One child	namaz	0.192
		Many children	namaz	0.191
	Widowed	No children	namaz	0.266
		One child	namaz	0.196
		Many children	namaz	0.122

This may indicate **as family size begins to change, the daily priorities are more emphasized.** For Muslim females and males, the term *Namaz* remains prominent, reinforcing the connection between religion and parenthood.

- **Many Children:** Hindu females with many children are highly associated with *housewife*, showing the idea that women with larger family sizes should maintain their homes. Hindu men and Muslim women are associated with domestic terms with lower TF-IDF values, reflecting a weaker, yet persistent, cultural tie to parental and domestic roles. Muslim males are consistently tied to *Namaz*, and in-

frequently terms like *chore* and *man*, demonstrating that **Muslim males are consistently tied to religious obligations, regardless of the number of children.**

G.32.4 Summary of Findings

- **Female identities:** Gendered roles are evident across all identities, with women consistently associated with domestic terms like *cooking* and *housework*. Hindu women, especially those with children, are highly expected to fulfill maternal and domestic roles in comparison to Muslim females. The expectation is still present for Muslim females, yet at a smaller scale.
- **Male identities:** Hindu men are expected to

contribute to domestic work, but at a much smaller scale than Hindu women. Muslim men show a stronger religious emphasis with terms like *Namaz* having higher Overall TF-IDF values, reflecting their connection to piety and spiritual leadership.

- **Impact of Marital Status:** Marital status impacts the term or term frequencies used for both genders. Widowed and divorced individuals sometimes amplify the frequent terms found for single or married individuals.
- **Impact of Children:** Muslim males and females have higher association with *Namaz* when they are married with no children, indicating ample association with prayer in marriage when there are no children present. The presence of children further strengthens the association between Hindu women and domesticity, while Hindu men and Muslim women, even with children, retain a focus on various household chores.

G.33 Top Bias Terms for Gujarati - Story

To analyze the highest bias terms from our bias lexicon in Gujarati story generations from the original prompting method, we highlight all 48 identities and associated bias scores in Table 37. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.33.1 Analysis of Gender and Religion

- **Hindu Female:** The dominant bias terms for Hindu females include *house* and *family*, with Bias TF-IDF values reaching 0.022. The term *house* is particularly frequent across all marital statuses, **indicating a strong stereotype associating Hindu women with the domestic sphere**. The highest bias scores appear for those married with no children (0.075) and divorced with one child (0.078), suggesting an expectation of domesticity, child-rearing, and traditional family roles.
- **Hindu Male:** Hindu males exhibit significantly lower bias scores compared to their female counterparts. The most frequent bias terms include *back* and *love*, with TF-IDF values up to 0.007. **Back indicates backwardness or withdrawal from expectations**. The lower bias scores (some as low as 0.006) **indicate fewer societal expectations placed on Hindu men in storytelling contexts**.
- **Muslim Female:** Like Hindu females, Muslim females are also strongly associated with the home, with terms such as *house* and *home* appearing across marital statuses, reaching TF-IDF values up to 0.023. Bias scores for married and widowed Muslim females are among the highest, reinforcing the notion of strong traditional roles for Muslim women in narratives. **Muslim females who are married with no children have the highest bias score with of 0.080, indicating Muslim females are highly expected the marry and reproduce**.
- **Muslim Male:** Muslim males show varying biased associations. The term *angry* appears in single Muslim male stories, while *conflict* and *happy* arise for those with children. **There are more positive terms for married individuals, and negative terms otherwise**. Bias scores for Muslim males (reaching up to 0.026) are generally lower than for Muslim females, suggesting that gendered expectations are stronger for women in this religious category.

G.33.2 Marital Status-Based Analysis

- **Single Individuals:** Single Hindu and Muslim females are often linked to *house* and *home*, **reinforcing the expectation that**

Table 37: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Story** in Gujarati outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.040	house	0.009
		One child	0.065	home	0.013
		Many children	0.049	house	0.011

		One child	0.006	back	0.003
		Many children	0.010	back	0.003
Muslim Female	Single	No children	0.044	house	0.010
		One child	0.048	house	0.014
		Many children	0.042	home	0.007
	Married	No children	0.080	house	0.023
		One child	0.051	house	0.008
		Many children	0.056	family	0.012
	Divorced	No children	0.039	house	0.008
		One child	0.065	house	0.016
		Many children	0.031	house	0.008
	Widowed	No children	0.038	home	0.010
		One child	0.031	house	0.009
		Many children	0.057	house	0.022
Muslim Male	Single	No children	0.006	angry	0.002
		One child	0.019	pressure	0.005
		Many children	0.022	sad	0.003
	Married	No children	0.019	allow	0.003
		One child	0.025	happy	0.004
		Many children	0.026	happy	0.004
	Divorced	No children	0.009	aim	0.002
		One child	0.017	change	0.004
		Many children	0.016	conflict	0.005
	Widowed	No children	0.009	traditional	0.004
		One child	0.017	bad	0.003
		Many children	0.010	car	0.003

women should remain connected to the domestic space even when unmarried. Single Muslim males show a minor association with negative terms such as *angry* and *pressure*, hinting at an underlying stereotype of aggression or social burden. Hindu males exhibit terms like *back*, showing themes of withdrawal from social expectations.

- **Married Individuals:** The highest bias scores appear in married categories, especially for Hindu and Muslim females, with *house* and *family* being dominant. Muslim married females have the highest bias score at 0.080, suggesting a strong expectation of traditional roles in narratives. Muslim and Hindu males show top terms like *happy* and *love*, indicat-

ing success associated with those that are married.

- **Divorced and Widowed Individuals:** Negative connotations emerge more strongly for divorced and widowed individuals. Hindu divorced females are associated with *death*, indicating societal negativity toward divorced women. Bias scores for divorced and widowed Muslim females are also high, reinforcing the stigma surrounding these statuses. Men are associated with *bad*, *failure*, *conflict*, showing negative stereotypes when individuals are not following marital expectations.

G.33.3 Number of Children-Based Analysis

- **No Children:** Males without children often exhibit lower bias scores compared to those with children. Women without children, especially married females, have very high bias scores. **This shows that women face higher expectations to marry then reproduce.**
- **One Child:** The presence of one child slightly increases bias scores, particularly for divorced Hindu and Muslim women, where terms like *family* and *house* persist. For men, the changes in bias terms are minimal, **indicating fewer expectations regarding fatherhood.**
- **Many Children:** High bias scores appear when many children are present for married and widowed females, **reinforcing the notion that women with multiple children are strongly tied to family and domestic roles.** Muslim and Hindu men show moderate to low bias scores with larger family sizes.

G.33.4 Summary of Findings

- **Gender-Based Trends:** Women, especially Hindu and Muslim females, face higher bias scores, with terms like *house* and *family* appearing across statuses. Men show fewer biased associations overall.
- **Marital Status Influence:** Marriage is associated with higher bias scores for women, reinforcing traditional domestic roles. Divorced men and women show negative bias terms, and divorced women have high bias scores. Married and widowed women also have high bias scores, indicating a connection to domestic roles.
- **Impact of Children:** Bias scores are high for women that are married without children, showing bias against those that do not meet societal expectations of marriage and reproduction. Number of children generally does not impact bias scores drastically for male identities.
- **Overall Bias Patterns:** The highest overall bias score (0.080) appears for married Muslim females, reinforcing stereotypes of traditional roles. Conversely, Hindu and Muslim males generally exhibit lower bias scores.

G.34 Top Bias Terms for Gujarati - Hobbies and Values

To analyze the highest bias terms from our bias lexicon in Gujarati generations of hobbies and values from the original prompting method, we highlight all 48 identities and associated bias scores in Table 38. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.34.1 Analysis of Gender and Religion

- **Hindu Female:** The most frequently occurring bias term for Hindu females is *kind*, with high TF-IDF values, appearing across all marital statuses. This suggests a strong stereotype **associating Hindu women with kindness and nurturing qualities**. The term *household* also appears for Married Hindu females with many children (0.029), **indicating a bias linking women with household responsibilities**. The bias score for Hindu females ranges from 0.023 to 0.114, with **Married Hindu women having the highest scores, suggesting increased societal expectations on them**.
- **Hindu Male:** The terms *kind* and *love* appear prominently for married Hindu males, **showing that kindness and affection is associated with married Hindu men**. Terms such as *confidence* and *leader* also appear indicate an expectation of leadership and confidence in Hindu men. **The bias score for Hindu males varies from 0.010 to 0.119, with the highest bias seen for married Hindu males with many children**. There are moderate to low bias scores for divorced Hindu males, with terms related to conflict and control.
- **Muslim Female:** The term *kind* appears frequently, especially for married Muslim females with no children, **reinforcing a stereotype of Muslim women as kind and nurturing**. The term *household* appears commonly for widowed women with many children, reinforcing traditional gender roles. **The bias score for Muslim females ranges from 0.039 to 0.114, with the highest score for married Muslim women with many children, suggesting a strong bias linking them to happiness and family roles**.
- **Muslim Male:** The term *freedom* appears for Single Muslim males with No Children (0.016), suggesting an association with independence. There are no bias terms detected for widowed males with no children. *Power* often appears for divorced and widowed identities, potentially linking Muslim men with strength and control. **The bias score for Muslim males ranges from 0.000 to 0.077, with married Muslim men experiencing more bias related to satisfaction and affection**

associated with marriage and having children.

G.34.2 Marital Status-Based Analysis

- **Single:** Single Hindu and Muslim males show associations with independence (*freedom, confidence*). Single Hindu and Muslim females are more associated with *kindness*, reinforcing gendered expectations.
- **Married:** Married individuals of both religions have the highest bias scores, **reflecting societal expectations of stability, family, and responsibility**. Women (both Hindu and Muslim) are frequently linked with *household* and *kindness*, while men are linked with *love* and *kind*.
- **Divorced:** Bias scores for Divorced individuals are moderate, with Hindu and Muslim women still linked to *kindness*. Divorced men, particularly Muslims, are linked to terms indicating dominance and control.
- **Widowed:** Bias scores for Widowed men are the lowest, particularly for Muslim widowed men with no children (0.000), showing that fewer biases are associated with them. Widowed women are still linked to *kindness*, **suggesting persistent gender expectations in women even after losing a spouse**.

G.34.3 Number of Children-Based Analysis

- **No Children:** Hindu and Muslim women (both married and unmarried) are frequently associated with *kindness*. Hindu and Muslim men have more varied associations, including *confidence* and *freedom*. For all identities married with no children, there are high bias scores. **This implies that there are highly biased phrases associated with those that are married and have not yet produced children.**
- **One Child:** Bias scores decrease slightly, but women are still linked with *kindness*, emphasizing gentle nature. Hindu and Muslim males show associations with *love* and *responsibility*, especially when married.
- **Many Children:** The highest bias scores appear for Married Hindu and Muslim females, particularly with the term *household*. Married Hindu and Muslim males are linked to *love*

Table 38: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Hobbies and Values** in Gujarati outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF

		One child	0.032	independent	0.014
		Many children	0.037	independent	0.015
	Married	No children	0.077	kind	0.019
		One child	0.027	love	0.009
		Many children	0.033	kind	0.011
	Divorced	No children	0.019	power	0.011
		One child	0.008	direction	0.008
		Many children	0.010	traditional	0.005
	Widowed	No children	0.000	N/A	N/A
		One child	0.009	responsibility	0.006
		Many children	0.028	power	0.007

and *control*, reinforcing gender roles in large families.

G.34.4 Summary of Findings

- **Gendered Bias:** Women are more often linked with *kindness* and *household* responsibilities, reinforcing traditional gender roles.
- **Religious Stereotypes:** Muslim men are more associated with *power* and *freedom*, reflecting societal biases about dominance.
- **Marital Expectations:** Married individuals have the highest bias scores, reflecting the strong societal expectations placed on marriage and family life.
- **Children and Bias:** Women with many chil-

dren are most linked with household-related terms, while men are associated with leadership and responsibility. For all identities, marriage without children shows the highest bias scores, implying biased language against those that do not meet marital and child-bearing expectations.

G.35 Top Bias Terms for Gujarati - To-do List

To analyze the highest bias terms from our bias lexicon in Gujarati generations of daily activities from the original prompting method, we highlight all 48 identities and associated bias scores in Table 39. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.35.1 Analysis of Gender and Religion

- **Hindu Female:** Hindu females exhibit higher bias scores compared to their male counterparts, particularly when married or with many children. The most frequent terms associated with this identity are *chore*, *household*, and *clean*, **reinforcing stereotypes of Hindu women as responsible for domestic duties.** The highest TF-IDF term value (0.128) is for *household* in the widowed category with many children, indicating a strong association between widowhood and household responsibilities. Bias scores for Hindu females range from 0.179 to 0.391, showing a significant societal expectation tied to domestic labor. The highest bias score is observed for widowed Hindu females with many children.
- **Hindu Male:** Bias scores for Hindu males are generally lower than those of females, with terms like *management*, *market*, and *responsibility* being most common. These terms **suggest an association with financial or professional roles rather than household duties.** The highest TF-IDF term value (0.029) is for *management* in the married with one child category, reinforcing the stereotype that men are expected to manage affairs rather than perform household tasks. **Bias scores for Hindu males range from 0.019 to 0.084, significantly lower than their female counterparts.** The highest bias score is observed for married Hindu males with children.
- **Muslim Female:** Similar to Hindu females, Muslim females exhibit high bias scores, particularly when married or having many children. Terms like *chore*, *cook*, and *household* dominate, reinforcing traditional domestic expectations. The highest TF-IDF term (0.066) is for *cook* in the married with no children category, **indicating an assumption that Muslim women with no children are primarily responsible for cooking.** Bias scores for Muslim females range from 0.157 to 0.323. **The highest bias score is 0.323 for married women with many children, indicating increased domestic responsibilities.**
- **Muslim Male:** Muslim males have the lowest bias scores overall, with terms like *management*, *responsibility*, and *offer* appearing most

frequently. These terms suggest an emphasis on financial or religious duties rather than domestic labor. The highest TF-IDF value (0.024) is for *offer* in the single with one child category, potentially reflecting financial obligations. **Bias scores for Muslim males range from 0.013 to 0.062, the lowest among all groups.**

G.35.2 Marital Status-Based Analysis

- **Single:** Single women, both Hindu and Muslim, are strongly associated with domestic work, with terms like *chore* appearing frequently. In contrast, single men are linked to *restraint*, *management*, and *responsibility*, **reinforcing the stereotype that single men are independent and career-oriented while single women are expected to manage household tasks.**
- **Married:** Marriage increases bias scores for both genders but disproportionately affects women. Hindu and Muslim married women see an increase in associations with *household*, *chore*, and *cook*, with Bias TF-IDF values as high as 0.118 for *household*. Meanwhile, married men are linked to *management* and *market*, **indicating an expectation to provide rather than perform domestic duties.**
- **Divorced:** Divorced women face a significant rise in bias scores, particularly when they have children. Terms like *clean*, *chore*, and *household* persist, **reinforcing the stereotype of divorced women being burdened with household responsibilities.** Hindu divorced women with many children exhibit a high bias score of 0.366, with *household* (TF-IDF 0.099) being the most associated term. Divorced men, on the other hand, retain low bias scores and are linked to *responsibility*.
- **Widowed:** Bias scores for widowed women are among the highest, particularly for those with many children. Terms like *household* and *chore* dominate, with Bias TF-IDF values reaching 0.128. **This reflects the societal perception that widowed women must manage domestic responsibilities alone.** Widowed men, however, have much lower bias scores and are associated with *management*, reinforcing a perception of financial independence.

Table 39: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **To-do List** in Gujarati outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.180	clean	0.045
		One child	0.235	chore	0.055
		Many children	0.185	household	0.055
	Married	No children	0.229	chore	0.048
		One child	0.257	chore	0.070
		Many children	0.391	household	0.118
	Divorced	No children	0.231	clean	0.041
		One child	0.234	cook	0.049
		Many children	0.366	household	0.099
	Widowed	No children	0.219	chore	0.042
		One child	0.179	chore	0.038
		Many children	0.351	household	0.128
Hindu Male	Single	No children	0.026	restraint	0.010
		One child	0.020	back	0.011
		Many children	0.023	management	0.014
	Married	No children	0.033	kind	0.013
		One child	0.081	management	0.029
		Many children	0.084	market	0.020
	Divorced	No children	0.026	restraint	0.010
		One child	0.027	responsibility	0.010
		Many children	0.032	management	0.019
	Widowed	No children	0.035	market	0.020
		One child	0.064	management	0.027
		Many children	0.019	responsibility	0.011
Muslim Female	Single	No children	0.270	chore	0.056
		One child	0.157	cook	0.029
		Many children	0.266	chore	0.061
	Married	No children	0.275	cook	0.066
		One child	0.186	chore	0.040
		Many children	0.323	household	0.059
	Divorced	No children	0.186	chore	0.035
		One child	0.168	clean	0.038
		Many children	0.302	clean	0.060
	Widowed	No children	0.235	chore	0.046
		One child	0.185	chore	0.039
		Many children	0.236	chore	0.047
Muslim Male	Single	No children	0.060	maintenance	0.017
		One child	0.038	offer	0.024
		Many children	0.062	responsibility	0.015
	Married	No children	0.044	management	0.022
		One child	0.032	management	0.013
		Many children	0.038	management	0.010
	Divorced	No children	0.019	responsible	0.010
		One child	0.024	offer	0.016
		Many children	0.022	obligation	0.009
	Widowed	No children	0.013	offer	0.008
		One child	0.045	strict	0.011
		Many children	0.037	management	0.022

G.35.3 Number of Children-Based Analysis

- **No Children:** Women without children still face bias in domestic expectations, with terms like *clean* and *chore* appearing frequently. The Bias TF-IDF values for these terms are lower compared to those with children, indicating a slight reduction in domestic expectations. Men without children exhibit the lowest bias scores, with associations to *restraint* and *maintenance*.
- **One Child:** Women with one child show a slight increase in bias scores, with an increased association with *chore* and *cook*, reinforcing traditional caregiving roles. Men with one child remain linked to *management* and *responsibility*.

- **Many Children:** Bias scores peak for women with many children, particularly for Hindu and Muslim married individuals, widows, and divorcees. Terms like *household* (TF-IDF 0.128) and *chore* dominate, reinforcing the stereotype of a mother burdened with domestic work. In contrast, men with many children see only a minor increase in bias scores, with terms like *responsibility* and *management* remaining prevalent.

G.35.4 Summary of Findings

- **Gender Disparity:** Women face significantly higher bias scores than men, with strong associations to domestic labor (*chore*, *clean*, *cook*, *household*). Men are predominantly linked to financial and managerial roles (*management*,

responsibility, market).

- **Religious Influence:** Muslim women tend to have higher bias scores than Hindu women, particularly in the married category, reinforcing stereotypes of traditional roles. Muslim men have the lowest bias scores overall.
- **Marital Status and Bias:** Marriage and widowhood increase bias for women, with *household* and *chore* appearing frequently. Single men have some of the lowest bias scores, reflecting societal perceptions of independence.
- **Impact of Children:** Women with many children face the highest bias scores, reinforcing expectations of domestic burden. Men's bias scores remain low regardless of the number of children, highlighting a disparity in societal expectations.
- **Key Bias Terms:** The most frequently associated bias terms are *chore*, *clean*, and *household* for women, while men are linked to *management* and *responsibility*. The highest Bias TF-IDF value is 0.128 for *household* in widowed Hindu women with many children, highlighting a strong bias towards domestic expectations.

G.36 Top Overall Terms for Gujarati - Story

To analyze the most frequent terms from the applications and 48 identities Gujarati generations of stories under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 40. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.36.1 Analysis of Gender and Religion

- **Hindu Female:** Common terms include *woman* (TF-IDF up to 0.046), *come* (up to 0.040), and *marry* (0.039). The term *woman* appears across various marital statuses, **reinforcing gender identity**. The term *marry* appears most for divorced women with many children, **implying an emphasis on past marriages or remarriage**.
- **Hindu Male:** Notable terms include *house* (TF-IDF up to 0.052), *man* (up to 0.041), and *marry* (0.044), *die* (0.044). The term *house* appears most frequently for married and widowed Hindu men, **emphasizing household responsibility**. The term *marry* is associated more with divorced Hindu males, **suggesting a narrative of remarriage or societal pressure**.
- **Muslim Female:** The most frequent term is *woman* (TF-IDF up to 0.070), appearing across all categories, **reinforcing strong gendered associations**. The term *house* (0.045) is frequently found among married Muslim women, suggesting a domestic focus. The term *husband* (0.035) appears for divorced Muslim women, **emphasizing spousal relationships even post-divorce**. The term *die* (0.044) appears for widowed individuals, suggesting descriptions of death.
- **Muslim Male:** The most frequent terms include *house* (TF-IDF up to 0.054), *go* (0.041), and *marry* (up to 0.039). The term *house* appears across multiple identities but has the highest TF-IDF for married Muslim men, reinforcing connections to home and family. **The term *marry* appears frequently for both divorced Muslim men, suggesting remarriage as a common theme.**

G.36.2 Marital Status-Based Analysis

- **Single Individuals:** Single Muslim females have the highest TF-IDF for *woman* (0.070), **reinforcing individual identity over relationships**. Single Hindu males have *one* (0.044), **possibly indicating self-reliance**.
- **Married Individuals:** Married Hindu and Muslim men have *house* as a dominant term, **reflecting strong associations of married men and their homes**. Married women

Table 40: Highest Overall TF-IDF terms and values for all identities under the application **Story** in Gujarati outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	boy	0.046
		One child	come	0.039
		Many children	one	0.039
	Married	No children	come	0.040
		One child	boy	0.032
		Many children	woman	0.040
	Divorced	No children	woman	0.046
		One child	come	0.038
		Many children	marry	0.039
	Widowed	No children	woman	0.039
		One child	die	0.038
		Many children	one	0.040
Hindu Male	Single	No children	one	0.044
		One child	come	0.030
		Many children	admit	0.037
	Married	No children	house	0.052
		One child	man	0.030
		Many children	one	0.030
	Divorced	No children	marry	0.043
		One child	leave	0.033
		Many children	marry	0.040
	Widowed	No children	man	0.041
		One child	die	0.044
		Many children	house	0.046
Muslim Female	Single	No children	woman	0.070
		One child	woman	0.035
		Many children	woman	0.055
	Married	No children	house	0.045
		One child	woman	0.027
		Many children	woman	0.038
	Divorced	No children	woman	0.041
		One child	husband	0.035
		Many children	woman	0.041
	Widowed	No children	woman	0.045
		One child	die	0.044
		Many children	woman	0.042
Muslim Male	Single	No children	go	0.041
		One child	come	0.042
		Many children	one	0.031
	Married	No children	house	0.054
		One child	go	0.034
		Many children	day	0.025
	Divorced	No children	marry	0.037
		One child	marry	0.030
		Many children	marry	0.039
	Widowed	No children	work	0.031
		One child	die	0.035
		Many children	house	0.044

across both religions frequently associate with *woman* and *house*, **reinforcing domestic roles**.

- **Divorced Individuals:** All identities frequently feature the term *marry*, **reflecting societal emphasis on remarriage** or discussion of past marriages. Divorced Muslim women have *husband* (0.035), **suggesting lingering societal focus on past relationships**.
- **Widowed Individuals:** For all widowed individuals with one child, *die* is a common term, indicating that death is highly associated with these generations. Hindu and Muslim widowed men have *house* appearing often, **reinforcing themes of solitude or responsibility**.

Widowed women, regardless of religion, have *woman* as a dominant term, **emphasizing individual status over relationships**.

G.36.3 Number of Children-Based Analysis

- **No Children:** Women with no children are often associated with *woman*, showing emphasis on gender identity. Males with no children are associated with *house*, especially Hindu males, demonstrating discussions of home and family for those without children.
- **One Child:**
 - The term *come* appears frequently across Hindu identities, indicating movement or transition in narratives, similar to the term *go* ap-

pearing for Muslim males. **The term *boy* (0.032) appears in Hindu female outputs, possibly indicating son preference.** Muslim women that are divorced or widowed with one child are associated with *husband* and *die* suggesting detailed generations on their previous marriages.

- **Many Children:** The term *woman* is highly frequent for Muslim females, **reinforcing maternal identity.** The term *one* appears across multiple groups, **possibly referencing singular focus despite multiple children.**

G.36.4 Summary of Findings

- **Gendered narratives:** Women, especially Muslim women, have *woman* as a dominant term, reinforcing identity-based storytelling.
- **Marriage emphasis:** The term *marry* appears frequently for divorced individuals, indicating societal pressure for remarriage.
- **Domestic focus:** The term *house* is common for married individuals, aligning with expectations of household responsibility.
- **Motherhood emphasis:** The term *woman* is more frequent for Muslim women with many children, reinforcing maternal roles.

G.37 Top Overall Terms for Gujarati - Hobbies and Values

To analyze the most frequent terms from the applications and 48 identities Gujarati generations of hobbies and values under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 41. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.37.1 Analysis of Gender and Religion

- **Hindu Female:** The term *woman* appears frequently across all categories, with TF-IDF values up to 0.105. This strong association suggests a **reinforcement of gender identity** in narratives related to Hindu females, particularly in contexts of marriage and motherhood. Additionally, the term *activity* appears prominently (0.069 to 0.106), indicating a focus on hobbies, responsibilities, or roles attributed to them. The appearance of *art* (0.084) in **widowed Hindu females may suggest an emphasis on creativity or traditional skills in their representation.**
- **Hindu Male:** The term *activity* is dominant for Hindu males, particularly those without children, suggesting a strong association with **engagement in various pursuits.** The presence of *father* (0.087) for married men with children **reinforces parental roles.** In contrast, the term *sport* (0.059–0.083) appears for divorced men with many children, **potentially reflecting gendered leisure interests.**
- **Muslim Female:** The term *woman* is overwhelmingly dominant for Muslim females, with the highest TF-IDF values across all identity groups (up to 0.121). This suggests that narratives about **Muslim women are explicitly marked by gender identity more than any other group.** The particularly high values for single and married Muslim women may indicate a strong societal focus on their status rather than their interests.
- **Muslim Male:** Unlike Hindu males, **Muslim males display greater lexical diversity.** The term *activity* is present but with lower TF-IDF values (up to 0.126), indicating engagement in various tasks, though not as dominant as in Hindu male narratives. *Sport* (0.083) appears for married Muslim males, suggesting a parallel with Hindu male leisure activities. The presence of *old* (up to 0.081) for **married and divorced Muslim males may indicate a stereotype linking aging and traditionalism.**

G.37.2 Marital Status-Based Analysis

- **Single:** Hindu and Muslim single males frequently feature *activity* as a dominant term, **reinforcing the notion of independence and**

Table 41: Highest Overall TF-IDF terms and values for all identities under the application **Hobbies and Values** in Gujarati outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	woman	0.093
		One child	activity	0.069
		Many children	woman	0.092
	Married	No children	woman	0.105
		One child	activity	0.095
		Many children	woman	0.086
	Divorced	No children	activity	0.095
		One child	woman	0.099
		Many children	activity	0.072
	Widowed	No children	woman	0.094
		One child	activity	0.106
		Many children	art	0.084
Hindu Male	Single	No children	activity	0.112
		One child	activity	0.083
		Many children	sport	0.059
	Married	No children	activity	0.118
		One child	father	0.087
		Many children	activity	0.072
	Divorced	No children	activity	0.098
		One child	sport	0.051
		Many children	activity	0.077
	Widowed	No children	activity	0.087
		One child	activity	0.088
		Many children	activity	0.063
Muslim Female	Single	No children	woman	0.108
		One child	woman	0.113
		Many children	woman	0.119
	Married	No children	woman	0.111
		One child	woman	0.108
		Many children	woman	0.097
	Divorced	No children	woman	0.104
		One child	woman	0.089
		Many children	woman	0.121
	Widowed	No children	woman	0.092
		One child	woman	0.091
		Many children	woman	0.081
Muslim Male	Single	No children	activity	0.085
		One child	man	0.046
		Many children	activity	0.054
	Married	No children	sport	0.083
		One child	father	0.079
		Many children	old	0.081
	Divorced	No children	activity	0.126
		One child	activity	0.080
		Many children	old	0.067
	Widowed	No children	activity	0.108
		One child	son	0.067
		Many children	large	0.057

engagement in personal pursuits. However, single Muslim females are overwhelmingly associated with the term *woman*, **emphasizing gender identity over personal interests.**

- **Married:** Married Hindu and Muslim males show high TF-IDF values for *activity* (up to 0.118) and *sport* (0.083), reinforcing narratives of engagement and recreation. Married women, particularly Muslim women, predominantly feature *woman*, **suggesting that their narratives are framed primarily around gender identity rather than specific activities.**
- **Divorced:** The term *activity* appears across all identities except for Muslim women identities,

indicating continued engagement in hobbies or responsibilities post-divorce. Muslim women that are divorced with many children are strongly associated with *woman*, indicating connection to gender identity.

- **Widowed:** For widowed Muslim males, the presence of *old* (up to 0.081) suggests a **possible stereotype linking widowhood with aging.** Otherwise, the predominant term for widowed males is *activity*, showing **broad interests.** Widowed Muslim women are associated most with *woman*, while **Hindu women are associated with their gender identity, broad activities, and specific interests (*art*).**

G.37.3 Number of Children-Based Analysis

- **No Children:** Across all identities, those without children tend to have higher TF-IDF values for *activity* (0.085 to 0.126), **suggesting engagement in hobbies and pursuits outside of parental responsibilities**. However, Muslim females without children are still primarily associated with the term *woman*, **reinforcing a gendered framing over personal interests**.
- **One Child:** The term *father* appears specifically for married Hindu and Muslim males, reinforcing parental roles. For Hindu women with one child, the frequent appearance of *activity* suggests engagement in various tasks. However, Muslim females with one child are still strongly linked to *woman*, indicating a persistent gendered framing.
- **Many Children:** Hindu and Muslim females with many children overwhelmingly feature *woman*, **reinforcing their identity primarily as mothers or feminine**. Interestingly, the term *art* (0.084) appears for Hindu widowed females with many children, suggesting an **association with creativity or traditional crafts**. For men, terms like *sport* (0.059) and *large* (0.057) **suggest narratives related to physical activity and family size**.

G.37.4 Summary of Findings

- Across all identities, women, especially Muslim women, are overwhelmingly associated with the term *woman*, suggesting that their identity is more strongly marked by gender than that of men.
- Hindu and Muslim males, particularly single and married men, have stronger associations with *activity*, reinforcing the notion of independence and engagement in various pursuits.
- The term *father* appears for married men with one child, reinforcing traditional parental roles, while no equivalent maternal term is dominant for married women.
- Muslim males, particularly married and divorced individuals with many children, show a unique association with the term *old*, suggesting a stereotype linking them to traditionalism and aging.

- Married men, particularly Hindu and Muslim males, are more frequently associated with hobbies (*activity*) and recreation (*sport*), whereas married women, particularly Muslim females, are primarily identified by their gender.
- The presence of children influences lexical patterns, with men continuing to engage in hobbies while women, especially those with many children, remain defined by their gender identity.

G.38 Top Overall Terms for Gujarati - To-do List

To analyze the most frequent terms from the applications and 48 identities Gujarati generations of daily activities under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 42. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.38.1 Analysis of Gender and Religion

- **Hindu Female:** Hindu females overwhelmingly feature terms related to *housework* and *household*, particularly in married and multiple children categories (TF-IDF up to 0.134). The recurrence of *housework* and *household* across all marital statuses suggests **strong gendered expectations linking women to domestic labor**. Compared to Muslim females, **Hindu females show higher TF-IDF values for domestic terms**, reinforcing stronger traditional gender roles.
- **Hindu Male:** Hindu males show **greater variation in terms**, with words like *meditation* (0.071), *task* (up to 0.070), and *financial* (0.057). The terms *household* and *housework* appear frequently for married and single men with many children. The term *housework* appears for Hindu males but with **lower TF-IDF values compared to Hindu females, reflecting a weaker association with domestic labor**. Compared to Muslim males, Hindu males have a stronger emphasis on personal and professional tasks (*task*, *system*), **indicating a more individual-focused identity than Muslim males**.
- **Muslim Female:** Muslim females also frequently feature *housework* (up to 0.103) and *woman* (up to 0.072), reflecting a narrative of traditional domestic roles and gender identity. **The presence of *cook* (0.089) and *clean* (up to 0.085) uniquely in Muslim women suggests an expectation of food preparation and cleaning not as evident in Hindu females**. Compared to Hindu females, Muslim females have fewer instances of explicitly high TF-IDF values for household-related terms, though they still dominate their category.
- **Muslim Male:** Muslim males feature terms like *daily* (up to 0.092), *advice* (0.072), and *breakfast* (0.072), indicating structured routines, advisory roles, and food related expectations. **Interestingly, Muslim males show the term *breakfast* and *cook* is seen for Muslim females, indicating an emphasis on food preparation in Muslim identities**. Unlike Hindu males, who display some emphasis on financial and meditation-related tasks, Muslim males show a stronger connection to advisory

sory roles, **potentially aligning with cultural perceptions of religious or patriarchal guidance**. Muslim males also exhibit a **lower emphasis on domestic labor compared to all other groups**, with *housework* appearing in fewer categories and at lower TF-IDF values.

G.38.2 Marital Status-Based Analysis

- **Single Individuals:** Single Hindu females and Muslim females prominently feature *housework*, reinforcing gendered expectations of household management. **Single Hindu males have the unique term *meditation*, suggesting self-improvement or religious practice**, which is absent from the female categories. Single Muslim males emphasize *daily* (0.048) and *financial* (0.053), **highlighting a focus on routine responsibilities**.
- **Married Individuals:** Married Hindu and Muslim females have high TF-IDF values for *housework* and *cook*, suggesting **strong domestic expectations**. Married Hindu and Muslim males have **relatively diverse tasks, with Hindu men showing more personal task variety** (*financial*, *task*, *system*) and **Muslim men leaning toward advisory roles** (*advice*, *financial*).
- **Divorced and Widowed:** All identities show *housework* and *household* as a dominant theme, suggesting **continued domestic labor expectations despite marital dissolution**. Muslim males show terms like *chore* and *advice*. Most identities have *daily* (TF-IDF = 0.083), reinforcing routine-based survival. Muslim widowed females emphasize *housework*. Divorced and widowed males have *chore* and *task* appearing often, showing a continued focus on professional and household tasks.

G.38.3 Number of Children-Based Analysis

- **No Children:** Hindu and Muslim females without children primarily feature *daily* and *housework*, suggesting routine-driven or domestic identities. Hindu and Muslim males without children emphasize routine personal or financial responsibilities (*daily*, *task*, *meditation*, *financial*).
- **One Child:** Hindu and Muslim females with one child continue to have *housework* or

Table 42: Highest Overall TF-IDF terms and values for all identities under the application **To-do List** in Gujarati outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	housework	0.086
		One child	chore	0.062
		Many children	housework	0.112
	Married	No children	housework	0.088
		One child	housework	0.105
		Many children	household	0.134
	Divorced	No children	daily	0.071
		One child	woman	0.060
		Many children	household	0.102
	Widowed	No children	daily	0.083
		One child	daily	0.050
		Many children	household	0.133
Hindu Male	Single	No children	meditation	0.071
		One child	day	0.069
		Many children	housework	0.106
	Married	No children	task	0.069
		One child	financial	0.057
		Many children	housework	0.082
	Divorced	No children	task	0.070
		One child	system	0.071
		Many children	household	0.092
	Widowed	No children	task	0.060
		One child	financial	0.061
		Many children	household	0.148
Muslim Female	Single	No children	housework	0.083
		One child	woman	0.067
		Many children	housework	0.091
	Married	No children	cook	0.089
		One child	woman	0.072
		Many children	housework	0.103
	Divorced	No children	woman	0.063
		One child	clean	0.053
		Many children	clean	0.085
	Widowed	No children	daily	0.079
		One child	housework	0.055
		Many children	housework	0.071
Muslim Male	Single	No children	daily	0.048
		One child	day	0.065
		Many children	financial	0.053
	Married	No children	advice	0.072
		One child	breakfast	0.072
		Many children	housework	0.057
	Divorced	No children	advice	0.056
		One child	breakfast	0.047
		Many children	chore	0.054
	Widowed	No children	daily	0.092
		One child	daily	0.054
		Many children	chore	0.053

woman, reinforcing gendered caregiving roles. Hindu males with one child emphasize *financial*, while Muslim males highlight *breakfast*, possibly reflecting involvement in childcare.

- **Many Children:** Hindu females with many children have high TF-IDF values for *household*, reinforcing heavy domestic labor expectations. Muslim females with many children feature *housework* and *clean*, suggesting a focus on maintenance and cleanliness. Hindu and Muslim males with many children both exhibit *housework*, indicating some level of domestic engagement, though at lower frequencies than females.

G.38.4 Summary of Findings

- **Gender:** Gendered expectations are strongly reflected in TF-IDF values, with Hindu and Muslim females overwhelmingly associated with *housework*, *household*, and *cleaning*, while males focus on *task*, *financial*, and *advice*.
- **Religion:** Religious differences appear more subtle but are still present. Muslim males show more association with *advice* and *financial* roles, whereas Hindu males lean toward *meditation* and *system*. However, Hindu females display slightly stronger TF-IDF values for household-related terms than Muslim females. Muslim identities have more terms

related to food preparation, which is not observed for Hindu identities.

- **Marital Status:** Married individuals across all groups have stronger associations with *housework* or *financial/task-based* words (males). Divorced and widowed females still feature domestic work, while males shift towards advisory or financial tasks.
- **Number of Children:** Number of children often amplifies term frequencies. Women with many children have the highest TF-IDF values for *household*, *housework*, and *clean*, reinforcing extreme domestic labor expectations. Hindu males with many children show increased domestic labor terms compared to Muslim males, but still much lower than females.

G.39 Top Bias Terms for Tamil - Story

To analyze the highest bias terms from our bias lexicon in Tamil story generations from the original prompting method, we highlight all 48 identities and associated bias scores in Table 43. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.39.1 Analysis of Gender and Religion

- **Hindu Female:** The most frequent bias terms associated with Hindu females are *home*, *house*, and *family*, with TF-IDF values reaching up to 0.033. The highest bias scores occur for married women with no children (0.109) and divorced women with one child (0.094) Hindu females, **reinforcing societal expectations that women are linked to domesticity**. Single Hindu females with many children are linked to *family* (TF-IDF 0.012), suggesting an association with domestic spaces and family even in unmarried states.
- **Hindu Male:** Hindu males show lower bias scores compared to Hindu females, with the highest score being 0.032 for a married male with one child. Terms like *love*, *happy*, and *good* appear for married males, **reflecting a more positive association for those that meet marital expectations**. Single Hindu males show some bias, with terms like *force* and *sad*, **indicating negative emotions with being unmarried**. Furthermore, divorced and widowed individuals have terms like *struggle* and *attack* appearing with low Bias TF-IDF values, reinforcing negative emotions with being unmarried.
- **Muslim Female:** Similar to Hindu females, Muslim females are frequently linked to *home*, *house*, and *family*. The highest Bias TF-IDF (0.031) appears for widowed Muslim females, associating them with *house*. **The word *isolate* (0.018) appears for single females with many children, reflecting social stigmas causing isolation, especially for unmarried women with children**. Similar to Hindu women, the same categories have the highest bias scores, such as **married with no children, married with many children, divorced with one child, and widowed with many children**.
- **Muslim Male:** Muslim males have lower bias scores than Muslim females. Terms like *force* and *fight* appear, **reinforcing stereotypes of aggression or struggle**. Similar to Muslim females, terms like *isolate* appear for single identities with many children, reinforcing social stigmas against having children before marriage.

Table 43: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Story** in Tamil outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.028	home	0.011
		One child	0.047	house	0.009
		Many children	0.062	family	0.012
	Married	No children	0.109	house	0.032
		One child	0.042	home	0.013
		Many children	0.073	family	0.030
	Divorced	No children	0.042	home	0.013
		One child	0.094	house	0.023
		Many children	0.058	family	0.012
	Widowed	No children	0.034	home	0.009
		One child	0.045	home	0.015
		Many children	0.089	house	0.033
Hindu Male	Single	No children	0.012	force	0.004
		One child	0.020	back	0.005
		Many children	0.012	sad	0.003
	Married	No children	0.020	good	0.007
		One child	0.032	love	0.013
		Many children	0.027	happy	0.009
	Divorced	No children	0.014	struggle	0.005
		One child	0.015	change	0.005
		Many children	0.017	hero	0.005
	Widowed	No children	0.013	back	0.006
		One child	0.011	back	0.005
		Many children	0.005	attack	0.001
Muslim Female	Single	No children	0.037	home	0.014
		One child	0.039	home	0.014
		Many children	0.057	isolate	0.018
	Married	No children	0.102	house	0.029
		One child	0.036	home	0.009
		Many children	0.081	family	0.014
	Divorced	No children	0.034	home	0.011
		One child	0.087	home	0.030
		Many children	0.037	home	0.008
	Widowed	No children	0.025	home	0.011
		One child	0.035	home	0.013
		Many children	0.091	house	0.031
Muslim Male	Single	No children	0.008	force	0.004
		One child	0.014	force	0.003
		Many children	0.023	isolate	0.008
	Married	No children	0.010	fix	0.003
		One child	0.020	love	0.013
		Many children	0.028	happy	0.007
	Divorced	No children	0.014	fight	0.006
		One child	0.020	fight	0.007
		Many children	0.009	fight	0.005
	Widowed	No children	0.007	fire	0.004
		One child	0.022	hero	0.006
		Many children	0.012	force	0.003

G.39.2 Marital Status-Based Analysis

- **Single:** Hindu and Muslim single females are primarily linked to *home* and *house*, reinforcing the stereotype of domesticity. Single Muslim males and females with many children show *isolate*, **reflecting societal stigma around single parenthood**. Single Hindu and Muslim males show smaller bias scores, with terms like *force* and *back* appearing, highlighting bias is more targeted against female identities.
- **Married:** The highest bias scores are seen in married Hindu and Muslim females, especially with no children. **This may indicate that married women face increased bias when they do not have children**. Married

males are linked to words like *love* and *happy*, **demonstrating positive attitudes associated with males that meet marital expectations**. Married Hindu females have a particularly high bias score (0.109), reflecting strong traditional expectations.

- **Divorced:** Divorced women (both Hindu and Muslim) have high bias scores, particularly linked to *home* and *house*. **This demonstrates women are still linked to domestic roles even after divorce**. Divorced men are linked to *struggle* and *fight*, **implying resilience or hardship**, and Hindu males with one child are linked to *change*, showing associations with life-changing transformation.

- **Widowed:** The highest bias scores for widowed individuals appear for Muslim and Hindu females, again **reinforcing domestic and dependent roles**. Words like *house* and *home* dominate. Widowed men show less bias, with words like *back*, *fire*, and *hero* appearing sporadically, **indicating resilience and withdrawal from society's expectations**.

G.39.3 Number of Children-Based Analysis

- **No Children:** Hindu and Muslim females with no children are linked to *home* and *house*, **reinforcing the expectation of domestic roles**. Bias scores for males without children are lower. For male identities, words like *struggle* and *force* appear, **indicating some levels of hostility**.
- **One Child:** Hindu and Muslim females with one child remain associated with *home*. Hindu and Muslim males with one child show words like *love* in married categories, and *change* or *hero* in widowed and divorced categories. This indicates a broader role, where marriage creates positive associations, having children also creates some positive associations.
- **Many Children:** Women with many children (both Hindu and Muslim) have the highest bias scores, **reinforcing expectations of caregiving**. The word *family* dominates, reflecting emphasis on family care narratives. Muslim males and females with many children show *isolate*, **reflecting societal stigma against those with children before marriage**. *Hero* appears for males with one or many children, **indicating an ideal standard**.

G.39.4 Summary of Findings

- **Gender and Religion Trends:** Hindu and Muslim females exhibit higher bias scores than males, consistently linked to *home*, *house*, and *family*. Muslim males show some association with *force* and *fight*, reflecting stereotypes of aggression.
- **Marital Status Trends:** Married and widowed women have the highest bias scores, reinforcing the expectation that women belong in domestic spaces. Married individuals are often associated the most with positive words, reflecting satisfaction expected from marriage. Divorced women also show high

bias scores, while divorced men are linked to hostility and resilience-oriented words like *struggle* and *fight*.

- **Number of Children Trends:** Women with many children have the highest bias scores, often linked to family. Single Muslim males and females are associated with *isolation* when they have many children, showing stigmas against having children before marriage. Men with one or many children are sometimes described with *hero*, showing an ideal standard.

G.40 Top Bias Terms for Tamil - Hobbies and Values

To analyze the highest bias terms from our bias lexicon in Tamil generations of hobbies and values from the original prompting method, we highlight all 48 identities and associated bias scores in Table 44. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.40.1 Analysis of Gender and Religion

- **Hindu Female:** The term *family* appears as the top bias term across all marital statuses and child categories, with TF-IDF values ranging from 0.011 to 0.105. Married and single Hindu females with many children exhibit the highest bias scores (0.149 and 0.100, respectively), reinforcing traditional expectations linking women to family roles. The consistent **association of Hindu women with *family* suggests an implicit societal expectation that their primary value is within the domestic sphere.** The appearance of *respect* for those married with one child **shows respect attributed to those that meet marital and child-rearing expectations.**
- **Hindu Male:** The term *responsibility* is more prominent, particularly among males with children. **Some identities, like single Hindu males without children show no significant bias (0.000),** reinforcing they are less bound by societal expectations. Married males are associated with positive terms, **reflecting social expectations of marriage are met, with the highest bias score for married males with many children (0.067).** Overall, Hindu males have lower bias scores compared to females, indicating **fewer societal stereotypes linked to hobbies and values.**
- **Muslim Female:** The term *family* is dominant but with additional bias terms such as *isolated* for single women, **highlighting a stereotype of seclusion for those that were never married.** Married Muslim females with many children have high bias scores (0.086), **reinforcing traditional roles of women in large families.** The term *clothe* (0.007) appears for widowed Muslim females without children, possibly reflecting expectations regarding modesty. Other terms associated with Muslim females are *kind*, showing expectations for females to be kind-natured.
- **Muslim Male:** The bias scores are low compared to female identities. The term *responsibility* appears across all categories, reinforcing the societal expectation of men as providers. **Single Muslim males without children show no significant bias (0.000), similar to Hindu males,** reinforcing minimal stereotyping in societal narratives. The term *activist* (0.006)

appears for divorced males with many children, which may indicate an association with social or political involvement. A protector role is emphasized for widowed males with no children.

G.40.2 Marital Status-Based Analysis

- **Single:** Hindu and Muslim single males without children have a bias score of 0.000, reflecting absence of detected bias terms. Single females without children show notable bias scores (0.041 for Muslim, 0.046 for Hindu), often linked to *family* and *isolation*, **reinforcing the stigma that unmarried women lack fulfillment.**
- **Married:** The highest bias scores occur in the married category, especially for those with many children. The term *family* is overwhelmingly present for females, **reinforcing expectations that married women should prioritize domestic life.** Males are associated with *good* and *kind*, showing **positive associations with those meeting marital associations.**
- **Divorced:** Hindu and Muslim divorced women are again linked to *family*. Muslim divorced males with many children have the term *activist* (0.006), possibly **hinting at stereotypes of social involvement or struggle.**
- **Widowed:** The term *clothe* (0.007) appears uniquely for widowed Muslim women, possibly referencing religious expectations regarding dress and modesty. Hindu widowed females have high bias scores linked to *family*, **reinforcing expectations that their value remains in their role as caretakers.** Widowed males are associated with terms like *responsibility*, **reflecting provider roles.**

G.40.3 Number of Children-Based Analysis

- **No Children:** Women are linked to *family*, showing persistent expectations even without children. Hindu and Muslim single males with no children have bias scores of 0.000, reinforcing the perception that they are free from societal obligations.
- **One Child:** Hindu married females with one child have a bias term *respect*, **suggesting that having children brings increased societal approval.** Muslim females with one child

Table 44: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Hobbies and Values** in Tamil outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.046	family	0.025
		One child	0.023	family	0.015
		Many children	0.100	family	0.072
	Married	No children	0.028	family	0.025
		One child	0.039	respect	0.016
		Many children	0.149	family	0.105
	Divorced	No children	0.039	family	0.012
		One child	0.012	family	0.010
		Many children	0.052	family	0.047

		One child	0.014	family	0.006
		Many children	0.055	family	0.052
Hindu Male	Single	No children	0.000	N/A	N/A
		One child	0.009	responsibility	0.009
		Many children	0.041	responsibility	0.018
	Married	No children	0.031	kind	0.016
		One child	0.028	kind	0.010
		Many children	0.067	good	0.018
	Divorced	No children	0.006	change	0.006
		One child	0.011	control	0.004
		Many children	0.038	engagement	0.019
	Widowed	No children	0.008	responsible	0.005
		One child	0.000	N/A	N/A
		Many children	0.012	ability	0.010
Muslim Female	Single	No children	0.041	isolated	0.014
		One child	0.027	kind	0.008
		Many children	0.028	family	0.013
	Married	No children	0.025	kind	0.013
		One child	0.016	happy	0.006
		Many children	0.086	family	0.050
	Divorced	No children	0.007	family	0.004
		One child	0.008	kind	0.005
		Many children	0.027	family	0.017
	Widowed	No children	0.026	clothe	0.007
		One child	0.011	kind	0.006
		Many children	0.030	family	0.015
Muslim Male	Single	No children	0.000	N/A	N/A
		One child	0.018	responsibility	0.008
		Many children	0.008	responsibility	0.008
	Married	No children	0.018	kind	0.013
		One child	0.023	kind	0.014
		Many children	0.027	responsibility	0.013
	Divorced	No children	0.003	responsibility	0.003
		One child	0.000	N/A	N/A
		Many children	0.013	activist	0.006
	Widowed	No children	0.005	protect	0.005
		One child	0.004	responsibility	0.004
		Many children	0.013	responsibility	0.005

have lower bias scores compared to those with many children, **indicating that stereotypes intensify with increasing family size**. Muslim females with one child are associated with *kind*, showing tenderness in motherhood.

- **Many Children:** This category exhibits the highest bias scores, particularly for married Hindu and Muslim women. The term *family* dominates, **reinforcing the societal view that women are primarily valued as caregivers when they have multiple children**. Men with children are associated with *responsibility*, **showing an increased level of duty attributed to men with children**.

G.40.4 Summary of Findings

- **Gender:** Women, especially married women with many children, exhibit the highest bias scores across both Hindu and Muslim identities. Their most frequent bias term is *family*, reinforcing traditional roles. Men, particularly single men, show the lowest bias scores. Single Hindu and Muslim males without children have a bias score of 0.000, reinforcing perceptions of male independence.
- **Marital Status:** Married individuals have the highest bias scores, particularly women. The term *family* appears for almost all married individuals, reinforcing societal expectations around family-centric roles.

- **Number of Children:** Bias increases with the number of children. Married Hindu and Muslim females with many children have the highest TF-IDF values, showing a strong association with caregiving roles.
- **Muslim Females:** Muslim women show bias linked to isolation and clothing expectations, while Hindu individuals are more strongly linked to family. This suggests that Muslim women, in particular, face additional stereotypes around modesty and social seclusion.

G.41 Top Bias Terms for Tamil - To-do List

To analyze the highest bias terms from our bias lexicon in Tamil generations of daily activities from the original prompting method, we highlight all 48 identities and associated bias scores in Table 45. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.41.1 Analysis of Gender and Religion

- **Hindu Female:** The highest Bias TF-IDF terms for Hindu females include *chore*, with high bias scores across marital statuses and children categories. This term is mentioned frequently, with the highest TF-IDF value of 0.131 in the married identities. This indicates a strong bias towards associating Hindu women with household tasks. The bias scores for Hindu females range from 0.139 to 0.380, **reflecting a notable societal expectation that women, particularly those with children, are expected to take on domestic chores.**
- **Hindu Male:** Hindu males are primarily associated with the term *responsibility*, which shows consistent bias across all marital statuses and children categories. The bias scores are lower than those of Hindu females, showing lower levels of bias. This reflects societal expectations that men are responsible, yet there is a significant reduction in bias compared to women.
- **Muslim Female:** For Muslim females, *chore* appears as the most frequent bias term. The term *chore* reflects a bias towards associating Muslim women with household tasks, much like Hindu women. However, **their bias scores are slightly lower, reaching 0.207, which may indicate a somewhat less intense societal expectation around these roles.** The bias is notably more pronounced for Muslim females who are single and have no children, **possibly indicating a lack of spousal and parental roles has an increased expectation towards domestic duties.**
- **Muslim Male:** The terms *offer* and *responsibility* stand out for Muslim males. This term likely reflects the stereotype of men as providers, with a particular focus on their roles in offering or providing for their families. **Bias scores for Muslim males are generally low, ranging from 0.020 to 0.054, yet some scores are somewhat higher than Hindu male bias scores.**

G.41.2 Marital Status-Based Analysis

- **Single:** For both Hindu and Muslim females, the highest bias term is *chore*. This suggests that single women are still associated with

Table 45: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **To-do List** in Tamil outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.175	chore	0.077
		One child	0.156	chore	0.100
		Many children	0.207	chore	0.087
	Married	No children	0.280	chore	0.121
		One child	0.228	chore	0.131
		Many children	0.380	chore	0.106

		One child	0.139	chore	0.080
		Many children	0.290	chore	0.109
	Widowed	No children	0.271	chore	0.100
		One child	0.185	chore	0.109
		Many children	0.217	chore	0.095
Hindu Male	Single	No children	0.009	responsibility	0.006
		One child	0.058	responsibility	0.036
		Many children	0.039	responsibility	0.026
	Married	No children	0.037	hero	0.022
		One child	0.030	responsibility	0.019
		Many children	0.040	responsibility	0.024
	Divorced	No children	0.027	responsibility	0.012
		One child	0.033	responsibility	0.033
		Many children	0.034	responsibility	0.018
	Widowed	No children	0.021	obligation	0.011
		One child	0.055	responsibility	0.041
		Many children	0.026	responsibility	0.016
Muslim Female	Single	No children	0.207	chore	0.134
		One child	0.111	chore	0.072
		Many children	0.155	chore	0.094
	Married	No children	0.195	chore	0.087
		One child	0.111	chore	0.053
		Many children	0.163	chore	0.079
	Divorced	No children	0.142	chore	0.079
		One child	0.103	chore	0.075
		Many children	0.192	chore	0.098
	Widowed	No children	0.148	chore	0.097
		One child	0.114	chore	0.065
		Many children	0.133	chore	0.049
Muslim Male	Single	No children	0.020	offer	0.020
		One child	0.031	responsibility	0.017
		Many children	0.030	responsibility	0.014
	Married	No children	0.054	fulfill	0.022
		One child	0.035	responsibility	0.018
		Many children	0.027	responsibility	0.006
	Divorced	No children	0.032	offer	0.023
		One child	0.022	responsibility	0.014
		Many children	0.021	responsibility	0.011
	Widowed	No children	0.040	offer	0.022
		One child	0.042	responsibility	0.025
		Many children	0.030	responsibility	0.009

domestic tasks despite their unmarried status. In contrast, single Hindu males have very low bias scores, and are commonly associated with *responsibility*, showing independent responsible characteristics.

- **Married:** Married Hindu females, particularly those with many children, exhibit the highest bias scores (up to 0.380) with the term *chore* dominating. **This reflects the cultural expectation for married women to take on household duties. The bias for married Muslim females is slightly lower** but still indicates a bias towards traditional roles. For males, both Hindu and Muslim, the terms *responsibility*, *fulfill* and *hero* emerge, **indicating expectations of satisfaction and respon-**

sibility, but again, the bias scores are lower in comparison to females.

- **Divorced:** Divorced Hindu females show relatively high bias scores (up to 0.290 for many children), **suggesting societal stigma around divorced women and a continued expectation of them to fulfill domestic roles.** Muslim females show similar top terms but with lower bias scores. In contrast, divorced males of both religions (Hindu and Muslim) have low bias scores, **suggesting less stigma for divorced men.**
- **Widowed:** Widowed Hindu females show the higher bias scores than widowed Muslim females, reflecting societal expectations of wid-

owed women as primarily caretakers or homemakers. Widowed males, on the other hand, exhibit moderate bias scores across all widowed identities, with top terms focusing on being responsible.

G.41.3 Number of Children-Based Analysis

- **No Children:** For both Hindu and Muslim females with no children, the term *chore* appears frequently. This reflects an underlying societal bias that **even childless women are still expected to manage household tasks. For males, the bias remains minimal**, with Hindu males' bias scores ranging from reaching 0.037, and Muslim males having similarly low bias values.
- **One Child:** For females with one child, *chore* remains the most frequent term. **The bias score for Hindu females is higher, particularly for married women.** Male bias scores remain consistent with the *responsibility* term, indicating that the **expectation of responsibility persists for males, but with no major increases in bias compared to other statuses.**
- **Many Children:** The presence of many children leads to the highest bias scores for Hindu females (up to 0.380) with the term *chore*, **reinforcing the traditional view of women as caregivers.** For Muslim females, the bias remains relatively lower but still significant. For males, **the term *responsibility* dominates, with a minimal increase in bias for those with children.**

G.41.4 Summary of Findings

- **Overall Bias:** Hindu females show the highest bias scores across all categories, with *chore* being the most frequent bias term, particularly for those who are married with many children. Muslim females show similar bias trends, although their scores are slightly lower. The bias scores for Hindu and Muslim males are significantly lower, with *responsibility* being the primary bias term.
- **Gender Differences:** Gender plays a significant role in bias, with females, especially Hindu females, facing stronger societal expectations tied to household tasks and domestic chores. Males, on the other hand, are less stigmatized and are often associated with terms

like *responsibility* or *offer*, which reflect traditional gender roles of men as providers.

- **Marital Status and Children:** Single and widowed women face higher bias scores due to societal perceptions of their marital status, with terms like *chore* being associated with them at varying frequencies. Married women, particularly those with many children, exhibit the highest bias scores, reflecting the societal expectation for women to take on domestic roles. In contrast, males, regardless of their marital status or number of children, show lower bias scores.

G.42 Top Overall Terms for Tamil - Story

To analyze the most frequent terms from the applications and 48 identities Tamil generations of stories under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 46. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.42.1 Analysis of Gender and Religion

- **Hindu Female:** The most prominent terms for Hindu females include *private* (TF-IDF of 0.067), *work* (up to 0.095), and *patient* (0.080). The term *work* appears frequently across various marital statuses, **reinforcing the expected duties of women, while *patient* emphasizes the nurturing aspect of women, especially those with children.** The high frequency of *husband* across non-single identities, and *woman* in divorced identities, **suggests a connection to traditional family structures and gender roles.** Widowed women show higher TF-IDF values for *work* (0.095) and *baby* (0.087), **suggesting a focus on the shift in responsibility after the loss of a spouse.**
- **Hindu Male:** For Hindu males, the term *wife* appears prominently across marital statuses, **reflecting traditional gender roles that emphasize the centrality of marriage.** The term *work* (up to 0.106) appears across various statuses, **showing a strong link to professional or labor-related identities.** Interestingly, divorced Hindu males with many children often have the term *several*, which **could indicate a broader narrative involving multiple children or diverse familial responsibilities.** The term *die* (0.065) frequently appears for widowed Hindu males, **displaying narratives tied to death of a spouse.**
- **Muslim Female:** Muslim females show a mix of terms shared with Hindu women, such as *work* and *husband*. The TF-IDF values for *husband* is higher for Muslim women than Hindu women, indicating **increased dependence on husbands for Muslim women.** Top terms highlight *doctor* (0.088) for divorced women and *die* (0.084) for widowed women, **describing spousal illness and death for those without spouses.** The term *work* is prominent across all marital statuses, **reflecting the social expectation for women to balance domestic and professional roles.** Widowed Muslim females show higher TF-IDF values for *work* (0.093) and *husband*, **suggesting a continuation of duties and relationships despite the loss of a spouse.**
- **Muslim Male:** There are higher Overall TF-IDF values for Muslim males in comparison

to Hindu males. Muslim males show similar trends to Hindu males, with *wife* being a significant term across marital statuses, reinforcing the cultural importance of marriage. However, Muslim males also display stronger emphasis on *work* (up to 0.095), *admit* (0.092), and *several* (0.114), with the latter term appearing more frequently among divorced Muslim males. The term *work* appears often in their narratives, **reflecting the importance of labor and professional identity for Muslim men.** The **prominence of *friend* (0.092) for single Muslim males may suggest a broader social focus or friendships outside of the family sphere.**

G.42.2 Marital Status-Based Analysis

- **Single:** Single individuals, frequently feature the term *work*, reflecting **an independent identity tied to professional life.** Single Muslim males also show higher TF-IDF values for *friend* (0.092), **suggesting a more social or relational focus.** Single Hindu females highlight terms such as *private* (0.067) and *work* (0.075), which may suggest **a sense of autonomy but within traditional gender expectations.**
- **Married:** Married individuals, especially males, show a frequent appearance of the term *wife*, **reinforcing marital roles in both Hindu and Muslim identities.** Married women, both Hindu and Muslim, show the term *husband* **reflecting the centrality of the spouse in the family structure.**
- **Divorced:** Divorced individuals, particularly women, show an increased presence of terms like *husband*, indicating the continuing connection to family despite separation. Divorced males show terms like *wife*, similarly, **suggesting connection to spouses despite separation. Divorced Muslim women are associated with *doctor*, indicating health issues or career-oriented narratives.**
- **Widowed:** Widowed individuals more frequently **feature the term *work*, indicating a shift in responsibility or focus after the loss of a spouse.** Widowed Muslim males and Hindu females with one child, feature the term *baby* often, showing narrative of a young child. *Die* appears for Muslim females and

Table 46: Highest Overall TF-IDF terms and values for all identities under the application **Story** in Tamil outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF

		One child	baby	0.075
		Many children	wife	0.069

Hindu males, **indicating stories surrounding spousal death.**

males, indicating a similar priority towards family and other responsibilities.

G.42.3 Children-Based Analysis

- **No Children:** For women with no children, terms like *private*, *work*, and *doctor* dominate, reflecting autonomy and professional engagement. Hindu and Muslim males exhibit similar patterns, with *work* and *teacher* appearing for those without children.
- **One Child:** The term *work* and *husband* appears frequently for both Hindu and Muslim women, suggesting the balancing act between motherhood, spouses, and other responsibilities. The terms *wife* and *work* appear for

- **Many Children:** Terms like *patient*, *work*, and *husband* for females suggest a maternal and caregiving focus. Additionally, terms like *several* for males with many children reflects a broader narrative around family size and responsibilities.

G.42.4 Summary of Findings

- Terms like *work*, *wife*, and *husband* show emphasis on duties and spousal relationships.
- **Gender and Parenthood:** For males, terms like *wife* and *several*, potentially reflecting

a stronger emphasis on spousal relationships and larger family units.

- **Women**, especially those with children, are strongly associated with maternal and caregiving terms like *work*, *patient*, and *husband*, reflecting societal expectations around motherhood and family.
- **Marital Status**: Widowed and divorced women often show terms related to resilience, such as *work*, indicating the continued societal expectation for women to engage in both domestic and professional roles despite marital status changes. Widowed individuals are associated with *die*, indicating narrative about spousal loss.

G.43 Top Overall Terms for Tamil - Hobbies and Values

To analyze the most frequent terms from the applications and 48 identities Tamil generations of hobbies and values under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 47. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.43.1 Analysis of Gender and Religion

- **Hindu Female**: Hindu females, regardless of marital status, frequently show *preference* (TF-IDF up to 0.392) as a dominant term across all marital statuses. This highlights a general theme of choices and preferences being emphasized in their narratives. Women with children often display terms like *family*, *raise*, and *mother*, reinforcing the idea of family responsibility.
- **Hindu Male**: Similar to Hindu females, Hindu males, regardless of marital status, feature the term *preference* (up to 0.250), but they also show stronger associations with terms like *birth* (up to 0.169) and *large* (up to 0.126 for married with many children), **reflecting expectations of men's involvement in reproduction and family size**. The term *large* highlights societal emphasis on large families.
- **Muslim Female**: Muslim females also feature *preference* prominently (up to 0.328). *Woman* (up to 0.254) frequently appears in Muslim female narratives, **highlighting gendered expectations of women in Muslim contexts**. There's also an emphasis on *birth*, highlighting themes of having children.
- **Muslim Male**: Muslim males share common terms with Hindu males, such as *preference* (up to 0.308). However, terms like *man* (up to 0.249) suggest a more pronounced masculine identity in their narratives. This is **similar to the highlighted gender identity for Muslim females**. The term *husband* (0.117 for married with many children) further reflects a strong association with parenthood. Divorced males with many children are associated with *Muslims*, **showing a strong association with the Muslim identity or community after divorce**.

G.43.2 Marital Status-Based Analysis

- **Single**: Single individuals of both genders, across religions, exhibit a strong emphasis on terms like *preference*, indicating an association with personal choice and individual autonomy. Most single identities with one child (except Muslim male identities) feature terms like *raise* and *birth*, emphasizing parental roles. Single Muslim males with one child are asso-

Table 47: Highest Overall TF-IDF terms and values for all identities under the application **Hobbies and Values** in Tamil outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	preference	0.392
		One child	raise	0.161
		Many children	preference	0.113
	Married	No children	preference	0.237
		One child	mother	0.211
		Many children	family	0.152
	Divorced	No children	preference	0.258
		One child	preference	0.190
		Many children	preference	0.123
	Widowed	No children	preference	0.291
		One child	preference	0.219
		Many children	preference	0.089
Hindu Male	Single	No children	preference	0.250
		One child	birth	0.163
		Many children	family	0.115
	Married	No children	preference	0.178
		One child	birth	0.199
		Many children	large	0.126
	Divorced	No children	preference	0.228
		One child	birth	0.169
		Many children	large	0.112
	Widowed	No children	preference	0.171
		One child	birth	0.188
		Many children	unique	0.098
Muslim Female	Single	No children	preference	0.328
		One child	raise	0.138
		Many children	woman	0.217
	Married	No children	preference	0.326
		One child	birth	0.214
		Many children	woman	0.172
	Divorced	No children	preference	0.235
		One child	woman	0.254
		Many children	woman	0.248
	Widowed	No children	preference	0.304
		One child	preference	0.278
		Many children	woman	0.229
Muslim Male	Single	No children	preference	0.292
		One child	man	0.146
		Many children	man	0.124
	Married	No children	preference	0.271
		One child	birth	0.240
		Many children	husband	0.117
	Divorced	No children	preference	0.250
		One child	man	0.249
		Many children	Muslims	0.151
	Widowed	No children	preference	0.308
		One child	preference	0.251
		Many children	preference	0.150

ciated with *man*, showing emphasis on gender identity.

- **Married:** Married individuals, regardless of religion, also frequently mention *preference*, but married Hindu females particularly emphasize family roles with terms like *family* and *mother*. Meanwhile, married Muslim females feature terms like *woman* and *birth*, **reinforcing the importance of femininity and children in their identity**. Males are associated with *birth*, *large*, and *husband*, **showing an emphasis on having large families and dedicating time towards their marriages**.
- **Divorced and Widowed:** Divorced and widowed individuals, show an emphasis on *pref-*

erence, showing individual interests. There are varying terms like *Muslims* for Muslim divorced males, and *birth* for Hindu males, and *woman* for Muslim females. Yet, Hindu females are continually associated with *preference*.

G.43.3 Children-Based Analysis

- **No Children:** Individuals with no children across all identities tend to feature *preference*, which may reflect the idea of autonomy and freedom from parental obligations.
- **One Child:** Individuals with one child often see terms like *birth* associated with their status, reflecting societal narratives of reproduction and continuation of family.

- **Many Children:** Those with many children frequently feature terms like *man*, *woman*, *preference*, and *large*, highlighting the emphasis on gender, family, and interests.

G.43.4 Summary of Findings

- *Preference* is the dominant term across all identities, indicating individual interests.
- Males are often linked with *birth*, *large*, and *husband*, while women with *birth*, *woman*, and *family*, showing an emphasis on having families, especially large families.
- *Muslims* appears for divorced Muslim males with many children, indicating a connection to religion or the Muslim community.

G.44 Top Overall Terms for Tamil - To-do List

To analyze the most frequent terms from the applications and 48 identities Tamil generations of daily activities under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 48. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.44.1 Analysis of Gender and Religion

- **Hindu Female:** Hindu females predominantly feature the term *daily* with high TF-IDF values (up to 0.315), across different marital statuses and children counts. This term reflects a focus on everyday tasks and routines. **Notably, Hindu females with one child have the highest TF-IDF value for *daily*, possibly reflecting a societal emphasis on motherhood and routines.**
- **Hindu Male:** Hindu males also have *daily* as a recurring term across marital statuses, but with slightly lower TF-IDF values compared to females. This suggests that **while daily routine tasks are acknowledged, there is less emphasis on them in comparison to Hindu females.** The term *daily* appears most strongly for Hindu males who are married with one child, likely **reflecting a balance between routines and parenthood.**
- **Muslim Female:** For Muslim females, the term *daily* appears frequently with TF-IDF values up to 0.380. Similar to Hindu females, Muslim women are highly associated with routine tasks. **Similar to Hindu women, *daily* appears the most for those with one child, showing emphasis on parental routines.**
- **Muslim Male:** Muslim males show a similar trend, with *daily* being a prominent term (up to 0.288). However, the TF-IDF values are slightly lower compared to their female counterparts, **possibly indicating that Muslim men are not as strongly associated with routines.**

G.44.2 Marital Status-Based Analysis

- **Single:** There is a consistent emphasis on *daily* with moderate to high TF-IDF values. This suggests that single individuals maintain routines, especially women.
- **Married:** For married individuals, the term *daily* appears frequently for both men and women. However, married Hindu and Muslim females display higher TF-IDF values for *daily* compared to their male counterparts. This highlights that women are connected to routines, especially after marriage. The higher TF-IDF values for women, particularly those with one child, **reinforce the association of women with routines and family life.**

Table 48: Highest Overall TF-IDF terms and values for all identities under the application **To-do List** in Tamil outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	daily	0.213
		One child	daily	0.315
		Many children	daily	0.224
	Married	No children	daily	0.266
		One child	daily	0.297
		Many children	daily	0.254
	Divorced	No children	daily	0.223
		One child	daily	0.279
		Many children	daily	0.225
	Widowed	No children	daily	0.196
		One child	daily	0.307
		Many children	daily	0.194
Hindu Male	Single	No children	daily	0.253
		One child	daily	0.222
		Many children	daily	0.153
	Married	No children	daily	0.212
		One child	daily	0.311
		Many children	daily	0.205
	Divorced	No children	daily	0.228
		One child	daily	0.248
		Many children	daily	0.179
	Widowed	No children	daily	0.198
		One child	daily	0.273
		Many children	daily	0.177
Muslim Female	Single	No children	daily	0.276
		One child	daily	0.277
		Many children	daily	0.243
	Married	No children	daily	0.233
		One child	daily	0.314
		Many children	daily	0.234
	Divorced	No children	daily	0.235
		One child	daily	0.380
		Many children	daily	0.264
	Widowed	No children	daily	0.264
		One child	daily	0.295
		Many children	daily	0.222
Muslim Male	Single	No children	daily	0.238
		One child	daily	0.288
		Many children	daily	0.245
	Married	No children	daily	0.235
		One child	daily	0.281
		Many children	daily	0.239
	Divorced	No children	daily	0.279
		One child	daily	0.266
		Many children	daily	0.195
	Widowed	No children	daily	0.260
		One child	daily	0.249
		Many children	daily	0.200

- **Divorced and Widowed:** Divorced and widowed women show a stronger association with *daily*, especially when they have on child. **This suggests a societal expectation for women to continue managing daily routines even after major life changes like divorce or widowhood.** In contrast, divorced and widowed men show much lower TF-IDF values for *daily*. Generally, there are low to moderate TF-IDF values for *daily* in these marital categories.

G.44.3 Children-Based Analysis

- **No Children:** Across all identities, the presence of children does not significantly alter the prominence of *daily*. This suggests that

individuals are generally associated with a certain level of routine, even in the absence of children.

- **One Child:** The presence of one child increases the association with *daily* for both women and men. This may suggest that transitioning to parenthood is strongly connected with more structured daily routines.
- **Many Children:** *Daily* has higher TF-IDF values for widowed females with many children. Generally, *daily* occurs frequently across all identities, indicating daily routines for those with varying number of children.

G.44.4 Summary of Findings

- **Gendered Patterns:** Women, regardless of religion, are more commonly associated with the term *daily*, highlighting that women have more structured daily routines. Men, however, are generally less associated with daily tasks, with lower TF-IDF values for *daily*, except when they are married with one child. .
- **Marital Status:** Widowed and divorced males show lower connections to term *daily*, showing a possible shift in routine after spousal loss. Widowed and married females have high TF-IDF values for *daily*.
Children: The presence of children, especially one child, strengthens the link between *daily*. This emphasizes routines in parenthood. While men with children also feature *daily*, the association is less pronounced than for women.
- The lack of diverse vocabulary, with repeated words like *daily*, suggests that Tamil generations are constrained by low-resource limitations (V and S, 2023), leading to high similarity with prompt tokens.

G.45 Top Bias Terms for Telugu - Story

To analyze the highest bias terms from our bias lexicon in Telugu story generations from the original prompting method, we highlight all 48 identities and associated bias scores in Table 49. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.45.1 Analysis of Gender and Religion

- **Hindu Female:** The highest Bias TF-IDF terms for Hindu females include *home*, *family*, and *house*, with varying bias scores depending on the marital status and number of children. For instance, the term *home* appears frequently for single and divorced Hindu females, **indicating an association with domestic roles and expectations tied to the home environment**. The term *family* also surfaces as a top term for Hindu female identities with higher bias scores. Married Hindu females have the highest bias scores, indicating increased connection to domestic terms, with the highest bias score for those married with no children (0.089). This shows married individuals face the most bias, and those with no children face the highest bias. **The bias score for Hindu females ranges from 0.047 to 0.089, suggesting a notable bias towards domestic and traditional female roles.**
- **Hindu Male:** For Hindu males, the top bias term is *back*, with lower bias scores across all marital statuses. This indicates a **stereotype of Hindu men being backwards**. The term *happy* is associated with married Hindu males, **showing an expectation of emotional fulfillment linked to family and reproduction**. Overall, the bias scores for Hindu males are considerably lower than their female counterparts, which suggests that societal expectations of men are less pronounced compared to those of women.
- **Muslim Female:** Muslim females exhibit a bias towards terms such as *home*, *house*, and *family*, similar to Hindu females. The highest bias score occurs for married Muslim females with no children (0.080). **The term *condition* (a synonym for “status”) appears in the married category**, which could reflect societal assumptions about the status of married women. The bias score for Muslim females ranges from 0.017 to 0.080, with higher values associated with married women and those married with no children, **signifying that Muslim women are expected to fulfill traditional roles as homemakers and mothers.**
- **Muslim Male:** For Muslim males, the dominant bias term is *ambitious* and *sad* appears

Table 49: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Story** in Telugu outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.038	home	0.009
		One child	0.050	home	0.014
		Many children	0.058	family	0.014
	Married	No children	0.089	house	0.022
		One child	0.077	family	0.015
		Many children	0.061	family	0.016

		One child	0.048	death	0.013
		Many children	0.077	home	0.020
Hindu Male	Single	No children	0.022	back	0.005
		One child	0.010	back	0.006
		Many children	0.009	back	0.005
	Married	No children	0.025	grow	0.010
		One child	0.057	happy	0.015
		Many children	0.045	happy	0.023
	Divorced	No children	0.009	back	0.003
		One child	0.015	fight	0.004
		Many children	0.001	back	0.001
	Widowed	No children	0.007	back	0.005
		One child	0.017	back	0.009
		Many children	0.010	back	0.007
Muslim Female	Single	No children	0.027	lonely	0.005
		One child	0.034	family	0.008
		Many children	0.024	home	0.006
	Married	No children	0.080	house	0.023
		One child	0.059	condition	0.015
		Many children	0.046	family	0.011
	Divorced	No children	0.029	death	0.005
		One child	0.053	home	0.017
		Many children	0.017	home	0.008
	Widowed	No children	0.031	death	0.009
		One child	0.026	home	0.008
		Many children	0.061	house	0.018
Muslim Male	Single	No children	0.009	ambitious	0.003
		One child	0.012	car	0.002
		Many children	0.011	sad	0.004
	Married	No children	0.039	grow	0.014
		One child	0.038	happy	0.012
		Many children	0.029	happy	0.011
	Divorced	No children	0.008	allow	0.003
		One child	0.007	danger	0.002
		Many children	0.012	conflict	0.005
	Widowed	No children	0.007	management	0.002
		One child	0.004	force	0.002
		Many children	0.006	auto	0.002

for single identities, showing duality of expectations placed upon males. There are higher bias scores for married individuals, associated with terms indicating fulfillment, like *happy*. There are lower bias scores for divorced and widowed individuals. The term *conflict* appears for Divorced Muslim males with many children (TF-IDF of 0.005), **possibly suggesting a perception of tension or challenge in post-divorce life.** The overall bias scores for Muslim males are generally low, ranging from 0.004 to 0.039, indicating that **societal expectations for Muslim men are less intrusive compared to those for Muslim females or Hindu women.**

G.45.2 Marital Status-Based Analysis

- **Single:** Single Hindu females are associated with terms such as *home* and *family*, indicating a societal view of single women still being closely tied to traditional domestic roles. Single Muslim females show terms like *lonely* **reinforcing societal expectations of unmarried individuals being seen as isolated or incomplete.** In contrast, single Hindu males are associated with *back*, reflecting stereotypes of backwardness. Single Muslim males are associated with *ambitious*, indicating a focus on individualism, and *sad* indicating a void in being unmarried.
- **Married:** Married Hindu females are strongly associated with *house* and *family*. These

terms underscore the societal expectation that women, once married, are expected to maintain traditional domestic roles. Women with no children have the highest bias scores, **showing strong assumptions regarding women without children.** For married males, terms like *happy* and *grow* reflect societal views that equate family and reproduction with fulfillment and personal growth.

- **Divorced:** Divorced Hindu females are linked to terms like *home*, while divorced Muslim females exhibit a bias toward *death* for those without children, suggesting associations with domestic work and sometimes spousal death. The bias for divorced males is less pronounced, with terms like *back* appearing for Hindu males indicating a stereotype of backwardness. Muslim divorced males are associated with *danger* and *allow*, showing stereotypes of control and hostility. Yet, **the bias scores for males are lower than those of females.** Additionally, **The overall bias scores for divorced individuals are relatively low compared to married statuses.**
- **Widowed:** Bias scores are higher for widowed women with many children, showing a strong association with household work. Widowed females are also often associated with *death*, showing generations surrounding spousal death. **Widowed males show minimal bias, indicating a less stigmatized view of widowed men.** Widowed Hindu males are associated with *back*, showing the stereotype of backwardness. Muslim males are associated with more diverse terms like *management* and *force*, showing themes of aggression and responsibility.

G.45.3 Number of Children-Based Analysis

- **No Children:** Individuals without children, especially Hindu and Muslim females, are associated with terms like *home*, **indicating an expectation to maintain traditional roles despite not having children.** This is in stark contrast to male identities with low bias scores, suggesting minimal societal pressure on men related to the absence of children. **In general, the bias towards no children is more pronounced in females.**
- **One Child:** For females with one child, the

terms *family* (for Hindu females) and *condition* (for Muslim females) appear, reflecting societal assumptions about women being tied to domesticity even with only one child. **Condition**, as a synonym for status, reflects discussion of Muslim women's status when transitioning to having children. For married males, the terms *happy* reflect positive associations with fatherhood, albeit with relatively lower bias compared to females.

- **Many Children:** For females with many children, terms like *family* and *house* dominate, **reinforcing the societal view of women as caregivers and mothers.** In contrast, married males with many children are associated with terms like *happy* (TF-IDF of 0.023 for Hindu males), signifying positive perceptions of fatherhood. **Women have high bias scores when they have many children, whereas males have low bias scores.**

G.45.4 Summary of Findings

- **Overall Gender Bias:** Female identities, especially Hindu and Muslim women, are strongly associated with domestic terms such as *home*, *family*, and *house*, with higher bias scores compared to male identities. This suggests that society holds stronger expectations for women to fulfill traditional domestic roles, with Hindu females showing higher bias scores than Muslim females in certain categories.
- **Religious Bias:** Hindu females face more intense domestic role expectations compared to Muslim females, with terms like *house* and *family* appearing with higher bias scores in Hindu females. Muslim males, on the other hand, are linked to terms like *ambitious* and *conflict*, which reflect a stereotype of men as ambitious and potentially involved in conflict, but with lower overall bias scores. Hindu males are often associated with *back*, reinforcing the stereotype of backwardness.
- **Marital Status Bias:** Widowed and divorced individuals, particularly females, show higher bias towards terms such as *home* and *death*, highlighting domestic roles and spousal loss. In contrast, single males are associated with less biased terms, like and *ambitious*, suggesting that society does not view single men

as negatively as it does single or divorced women.

- **Children-Based Bias:** The presence of children increases bias for females, with terms like *family* and *home* dominating, signifying an expectation that women with children adhere to domestic roles. Males with children, however, are associated with more positive terms like *happy* and *grow* when married. For a single Muslim male with many children, the top bias term is *sad*, conveying negative emotions for a single parent in this case.

G.46 Top Bias Terms for Telugu - Hobbies and Values

To analyze the highest bias terms from our bias lexicon in Telugu generations of hobbies and values from the original prompting method, we highlight all 48 identities and associated bias scores in Table 50. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.46.1 Analysis of Gender and Religion

- **Hindu Female:** The highest Bias TF-IDF terms for Hindu females include *cook*, *family*, and *kind*. These terms **reflect the societal expectation for Hindu women to be associated with domestic roles and nurturing qualities, especially for those who are married or have children**. The bias score for Hindu females ranges from 0.021 to 0.114, indicating moderate to high bias across various marital statuses. The highest bias scores are found in the single and married categories.
- **Hindu Male:** For Hindu males, the most frequent bias term is *independent* (with a high TF-IDF of 0.045 in the Single-No-children category), reflecting the stereotype of independence associated with single men. Other common terms such as *satisfied* (0.008) and *love* (0.011) **reflecting positive traits associated with married or fatherhood status**. The bias scores for Hindu males are comparatively lower than for females, ranging from 0.000 to 0.053, indicating **less pronounced bias overall**. The bias scores are higher for married and single identities, with relatively low scores for divorced and widowed categories.
- **Muslim Female:** For Muslim females, the terms *cook* and *family* appear frequently, echoing similar domestic stereotypes seen in Hindu females. Additionally, *care* suggests an expectation of nurturing roles. The bias scores for Muslim females vary from 0.011 to 0.066, with **those who are married or have many children experiencing the highest biases**.
- **Muslim Male:** Muslim males have lower bias scores than their female counterparts, with terms like *protect*, *strong*, and positive terms for married individuals. The bias scores for Muslim males range from 0.000 to 0.025, indicating that while societal expectations around strength and protection are present, the **overall bias is relatively low compared to Muslim females**.

G.46.2 Marital Status-Based Analysis

- **Single:** Single Hindu and Muslim females are primarily associated with *cook*, **suggesting a bias that views them through the lens of**

Table 50: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Hobbies and Values** in Telugu outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.075	cook	0.019

		One child	0.018	care	0.007
		Many children	0.052	care	0.016
	Married	No children	0.036	kind	0.012
		One child	0.044	family	0.012
		Many children	0.066	family	0.022
	Divorced	No children	0.040	dress	0.017
		One child	0.015	family	0.010
		Many children	0.050	family	0.021
	Widowed	No children	0.033	family	0.011
		One child	0.021	traditional	0.012
		Many children	0.037	care	0.009
Muslim Male	Single	No children	0.005	protect	0.005
		One child	0.000	N/A	N/A
		Many children	0.000	N/A	N/A
	Married	No children	0.023	kind	0.010
		One child	0.025	kind	0.010
		Many children	0.016	happy	0.007
	Divorced	No children	0.005	difference	0.005
		One child	0.000	N/A	N/A
		Many children	0.015	strong	0.010
	Widowed	No children	0.000	N/A	N/A
		One child	0.000	N/A	N/A
		Many children	0.003	responsibility	0.003

domesticity. Single Hindu males are associated with terms like *independent*, *suffering*, and *protect*, **indicating a societal expectation that single men should be self-reliant, and those unmarried may face negative stereotypes.** Muslim females, especially single ones, also are associated with terms like *cook* and *care*, reinforcing gender roles. Muslim males, on the other hand, face little bias in single status, with terms like *protect* being the only notable term.

- **Married:** For married individuals, Hindu and Muslim females are associated with *family*, **reinforcing traditional roles.** Married Hindu and Muslim males have relatively low bias scores, with terms like *satisfied* and *kind*,

reflecting societal expectations of contentment in marriage. Hindu females experience higher bias in the married category.

- **Divorced:** Divorced Hindu and Muslim females are associated with terms like *clothe* and *dress*, reflecting themes of clothing emphasizes for these identities. Divorced Hindu males and Muslim males have low bias scores, and are associated with terms like *difference* and *strong*, showing resilience and unlikeness.
- **Widowed:** Widowed males also have very low bias scores with terms like *responsibility* and *strong* being common, showing resilience and leadership. Women are associated with *family* and nurturing. Interestingly,

widowed Muslim women with one child are associated with *traditional*. **Widowed women have lower bias scores than married individuals.**

G.46.3 Number of Children-Based Analysis

- **No Children:** Single women with no children have high bias scores. Hindu females with no children are associated with *cook* and *kind*, highlighting expectations of **domesticity and nurturing**. Hindu males with no children are less biased, with terms like *independent* and *satisfied*. Muslim females with no children are similarly linked to *cook*, reinforcing gendered expectations. Muslim males with no children are associated with terms like *protect*, reflecting the societal **expectation of providing security**.
- **One Child:** Hindu and Muslim females with one child face moderate to high bias, with family-oriented terms being dominant. **Males with one child are associated with terms like grow or no bias terms**, suggesting expectations of fatherhood and personal growth.
- **Many Children:** Hindu and Muslim **married females with many children experience high bias** with domestic terms as dominant terms. Hindu and Muslim males with many children have relatively low bias, with terms like *kind* appearing infrequently.

G.46.4 Summary of Findings

- **Bias Scores:** The highest bias scores are observed in Hindu and Muslim females, particularly those married with many children, with terms like *cook* and *family* dominating their vocabulary. Hindu and Muslim males experience significantly lower bias, with terms like *independent* and *satisfied* reflecting societal expectations of independence and contentment. Muslim males have the lowest bias scores, with no bias terms or some terms like *protect* and *kind* reflecting expectations of strength and protection.
- **Gender and Religion Analysis:** Hindu females experience the highest biases, particularly in terms of traditional domestic roles, while Muslim females are more likely to be associated with traditional, caring roles. Hindu males show significantly less bias compared

to females, with terms associated with independence. Muslim males, while facing some bias, particularly around strength and protection, experience the least overall bias.

- **Marital Status Analysis:** Single men are seen as independent, while single women are primarily associated with domestic roles. Divorced women have frequent terms related to clothing, suggesting specific social scrutiny.
- **Number of Children Analysis:** Women with many children face higher bias, especially with terms linked to family and care, while childless women are linked to terms like *cook* or *kind*. Men with children are seen as responsible, with relatively lower bias overall, especially compared to women.

G.47 Top Bias Terms for Telugu - To-do List

To analyze the highest bias terms from our bias lexicon in Telugu generations of daily activities from the original prompting method, we highlight all 48 identities and associated bias scores in Table 51. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.47.1 Analysis of Gender and Religion

- **Hindu Female:** The highest Bias TF-IDF terms for Hindu females include *chore* and *cook*, reflecting a strong bias toward associating Hindu women with household tasks. These terms appear across all marital statuses, with a particular emphasis on women with children. The bias score for Hindu females ranges from 0.138 to 0.203, indicating notable bias, especially for those who are married or divorced, with a higher bias for those with many children. Additionally, women that are married without children also have high bias scores, **indicating stigmas against those that do not meet expectations of having children.**
- **Hindu Male:** For Hindu males, the Bias TF-IDF terms like *management* and *kind* are associated with lower bias scores (ranging from 0.006 to 0.049). The bias towards Hindu males is significantly lower than for females, **suggesting that societal expectations for Hindu men are not as heavily biased or rigid as for Hindu women.**
- **Muslim Female:** For Muslim females, *chore* and *cook* dominate the bias terms, indicating a strong societal **expectation for Muslim women to engage in domestic chores.** The bias scores for Muslim females range from 0.109 to 0.215, reflecting a higher level of bias compared to Hindu females. Muslim women with many children also show higher bias scores (0.170), emphasizing traditional gender roles. The highest bias score is observed for Muslim women that are married with no children, **showing bias against those that do not meet societal expectations.**
- **Muslim Male:** For Muslim males, the Bias TF-IDF terms like *provide* reflect the societal stereotype of Muslim men being providers. The bias scores for Muslim males are lower (ranging from 0.004 to 0.054), similar to Hindu males, but the terms suggest a consistent association with providing or managing, **reinforcing the societal expectation of financial responsibility and authority.**

G.47.2 Marital Status-Based Analysis

- **Single:** For both Hindu and Muslim females, the Bias TF-IDF terms like *chore* and *cook*

appear prominently in the single category, **reflecting the expectation that women, regardless of religion, should maintain domestic roles.** Hindu and Muslim males, in contrast, have minimal bias terms such as *management* and *provide*, with very low bias scores. **Single men are seen as more responsible, which is reflected in the low bias scores.**

- **Married:** Married Hindu and Muslim females are consistently associated with *chore* and *cook*, suggesting societal expectations of married women to take on domestic responsibilities. These bias scores are higher than for single women, especially for Muslim females, where the bias score can go up to 0.215. **Married women without children have high bias scores,** indicating women are expected to marry and have children. The bias scores for males are relatively low. Married males, on the other hand, have terms like *kind* and *provide*, which **reflect sociability and increased responsibilities for married men.** Interestingly, *adoption* appears for married Hindu males with many children, suggesting larger family sizes may be due to adoption.
- **Divorced:** Divorced females show high bias scores, with terms like *chore* and *cook* remaining dominant. The bias scores for divorced males remain low, suggesting less societal stigma for men in similar situations.
- **Widowed:** Widowed females show similar trends to divorced women, with *chore* and *cook* often appearing as top bias terms. The societal expectation for widowed women to take on domestic roles remains high, despite the loss of a spouse. The bias scores for widowed males are again low, further emphasizing the less scrutinized societal image of men in comparison to women.

G.47.3 Number of Children-Based Analysis

- **No Children:** Both Hindu and Muslim females without children are associated with terms like *chore* and *cook*. The expectation for childless women to focus on household tasks persists. There are high bias scores for women that are married with no children, **showing the expectation for women to marry and have children.** For males, terms like *management* and *provide* dominate, with low bias scores,

Table 51: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **To-do List** in Telugu outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.162	cook	0.057
		One child	0.147	chore	0.104
		Many children	0.194	chore	0.067
	Married	No children	0.203	cook	0.063
		One child	0.145	chore	0.108
		Many children	0.180	chore	0.080
	Divorced	No children	0.138	chore	0.070
		One child	0.166	chore	0.085
		Many children	0.151	chore	0.063
	Widowed	No children	0.138	chore	0.050
		One child	0.121	chore	0.070
		Many children	0.141	chore	0.063
Hindu Male	Single	No children	0.023	management	0.009
		One child	0.041	provide	0.018
		Many children	0.011	maintenance	0.007
	Married	No children	0.006	kind	0.006
		One child	0.041	social	0.014
		Many children	0.030	adoption	0.014
	Divorced	No children	0.026	responsibility	0.012
		One child	0.011	management	0.006
		Many children	0.020	back	0.009
	Widowed	No children	0.023	management	0.010
		One child	0.015	protect	0.009
		Many children	0.049	provide	0.027
Muslim Female	Single	No children	0.150	chore	0.076
		One child	0.109	chore	0.050
		Many children	0.170	chore	0.041
	Married	No children	0.215	chore	0.067
		One child	0.137	chore	0.090
		Many children	0.207	chore	0.065
	Divorced	No children	0.187	chore	0.061
		One child	0.153	chore	0.084
		Many children	0.205	chore	0.063
	Widowed	No children	0.134	chore	0.036
		One child	0.119	chore	0.049
		Many children	0.199	cook	0.054
Muslim Male	Single	No children	0.004	provide	0.004
		One child	0.028	provide	0.024
		Many children	0.021	provide	0.021
	Married	No children	0.046	provide	0.014
		One child	0.014	provide	0.008
		Many children	0.054	provide	0.017
	Divorced	No children	0.018	provide	0.013
		One child	0.039	provide	0.014
		Many children	0.026	provide	0.019
	Widowed	No children	0.032	aim	0.015
		One child	0.025	offer	0.010
		Many children	0.042	provide	0.009

reflecting less societal pressure for childless men.

- **One Child:** The presence of one child slightly decreases bias scores for females, especially Muslim females. Terms *chore* and *cook* continue to be highly associated with female identities. This **reinforces the stereotype of women as primary caregivers**. For males, the bias remains relatively low, with terms like *provide* showing up more prominently, **suggesting an expectation for men to fulfill the role of a provider**.
- **Many Children:** Females with many children are most strongly associated with terms like *chore* and *cook*, especially for Muslim

women (bias values up to 0.170), **showing the stereotype of women being the primary caregivers, particularly in large families**. The bias scores are generally higher for these women compared to those with fewer children. For males, terms like *provide* and *maintenance* indicate the **stereotype of men being expected to provide for large families, but the bias scores are still lower than for females**.

G.47.4 Summary of Findings

- **Gender-Based Bias:** Female identities show the highest bias scores, with *chore* and *cook* as recurring terms. This reflects the societal expectation for women to engage in domestic work, regardless of marital status or num-

ber of children. In contrast, male identities, both Hindu and Muslim, show relatively low bias scores, with terms like *management* and *provide* reflecting the stereotype of men as providers, but with less societal pressure compared to women.

- **Religion-Based Bias:** Muslim females face higher bias scores compared to Hindu females, with stronger associations to terms like *chore* and *cook*. This suggests that Muslim women are more stereotypically associated with traditional, domestic roles than their Hindu counterparts. Male identities from both religions show minimal bias, indicating that the expectations for men are not as strongly shaped by religion.
- **Marital Status and Children-Based Bias:** Marital status and number of children significantly impact the bias scores. Married women face the highest bias, particularly in terms of domestic roles. Married women with and without children have highest bias scores, indicating the expectation to increase domestic work and to have children. In contrast, men, regardless of their marital status, face minimal bias, reflecting societal views of men as independent providers.

G.48 Top Overall Terms for Telugu - Story

To analyze the most frequent terms from the applications and 48 identities Telugu generations of stories under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 52. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.48.1 Analysis of Gender and Religion

- **Hindu Female:** The most frequent terms for Hindu females include *woman* (up to 0.076), *husband* (0.065), and *doctor* (0.089). The term *woman* is notably common across all marital statuses, emphasizing the gendered focus of narratives. The term *husband* appears in married women's narratives, reinforcing traditional gender roles that emphasize the spousal relationship. Additionally, the term ***doctor* is prominent for divorced Hindu women, potentially highlighting a narrative of independence or career success for women who break from traditional marital structures.**
- **Hindu Male:** For Hindu males, *wife* (up to 0.094) emerges as the most frequently used term across all marital statuses. This indicates a **strong focus on spousal relationships**, which aligns with the societal expectation of marriage. The term *wife* has the highest TF-IDF value for divorced Hindu males (0.094), further emphasizing the importance of spouses in their narratives. Interestingly, *admit* (0.081) appears more frequently for men with many children, which may reflect themes of confession or responsibility, commonly expected from men in family-oriented contexts.
- **Muslim Female:** Muslim females, similar to Hindu females, show frequent use of *woman* (TF-IDF up to 0.118) and *husband* (0.073), with a notably higher TF-IDF for *woman* compared to Hindu females. This could **suggest stronger gendered associations with traditional Muslim female roles.** The terms *admit* (0.102) and *woman* (up to 0.113) are prominent for Muslim females with many children, reflecting a narrative where the female identity is closely tied to motherhood and familial duties. These terms also suggest that Muslim females may face greater societal scrutiny, leading to narratives around admission or confession.
- **Muslim Male:** The most notable term for Muslim males is *wife* (0.096), which mirrors the trend seen in Hindu males. The term *admit* (0.133) stands out for Muslim males with many children, reinforcing the idea of responsibility or acknowledgment of their family

Table 52: Highest Overall TF-IDF terms and values for all identities under the application **Story** in Telugu outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	one	0.068
		One child	work	0.065
		Many children	woman	0.068
	Married	No children	husband	0.065
		One child	girl	0.050
		Many children	woman	0.068
	Divorced	No children	doctor	0.089
		One child	marry	0.060
		Many children	marry	0.075
	Widowed	No children	woman	0.076
		One child	woman	0.065
		Many children	three	0.046
Hindu Male	Single	No children	two	0.059
		One child	wife	0.062
		Many children	admit	0.081
	Married	No children	wife	0.084
		One child	daughter	0.041
		Many children	wife	0.080
	Divorced	No children	wife	0.094
		One child	marry	0.062
		Many children	marry	0.110
	Widowed	No children	wife	0.074
		One child	wife	0.057
		Many children	wife	0.057
Muslim Female	Single	No children	woman	0.118
		One child	woman	0.075
		Many children	admit	0.102
	Married	No children	husband	0.073
		One child	woman	0.079
		Many children	woman	0.073
	Divorced	No children	woman	0.108
		One child	woman	0.069
		Many children	woman	0.113
	Widowed	No children	woman	0.077
		One child	woman	0.081
		Many children	two	0.058
Muslim Male	Single	No children	man	0.077
		One child	man	0.057
		Many children	admit	0.133
	Married	No children	two	0.100
		One child	name	0.052
		Many children	wife	0.096
	Divorced	No children	marry	0.094
		One child	wife	0.059
		Many children	marry	0.072
	Widowed	No children	two	0.073
		One child	wife	0.072
		Many children	two	0.078

roles. The frequent mention of *wife* and *admit* suggests a focus on the familial obligations and responsibilities that are culturally significant in Muslim male narratives.

G.48.2 Marital Status-Based Analysis

- **Single:** Single women, especially Muslim females, frequently feature *woman* and *admit*. This shows that women are **associated with their gender identity and admission**. Similarly, Muslim males are associated with *man* and *admit*. Hindu males are associated with *wife*, possibly indicating the pressure for men to fulfill societal expectations of marriage.
- **Married:** Married individuals of both gen-

ders across Hindu and Muslim identities frequently have *wife* and *husband* as dominant terms. This reinforces that **men and women are primarily defined by their spousal relationships or lack of spousal relationships**.

- **Divorced:** Typically, *marry* appears across all identities except Muslim women, **indicating an emphasis on previous relationships or remarriage**. Divorced Hindu females frequently feature terms like *doctor*, **reflecting a departure from traditional norms** and possibly signifying empowerment or self-reliance. Divorced Muslim women also see a high TF-IDF for *woman*, **underscoring the continuing emphasis on gender identity despite**

marital status.

- **Widowed:** There is an **emphasis on numerical values**, such as *two*, possibly indicating duality or description of family sizes. For male identities, there is an emphasis on *wife*, **showing references to loss of their spouses**. The presence of *wife* may also emphasize a social and cultural expectation placed on widowed individuals to maintain a connection to their former spouses.

G.48.3 Children-Based Analysis

- **No Children:** Across all identities, individuals without children often feature terms like *wife*, *woman*, and *man*, reinforcing gender identity or the societal expectation for marriage even in the absence of children. The terms *two* and *man* are more commonly linked to Muslim men without children.
- **One Child:** Narratives for those with one child often highlight terms like *wife* and *woman*, *man*, *daughter*, reinforcing gender identity and spousal roles. For Hindu males, the term *marry* is prominent for those divorced with one child, suggesting a societal expectation for men to seek out marriage and family life.
- **Many Children:** Individuals with many children, especially women, frequently feature terms like *woman*, **suggesting that family and maternal identities are central themes for women with many children**. For men, the term *wife* remains dominant, particularly for Hindu males, signaling the strong societal linkage between fathers and their spouses.

G.48.4 Summary of Findings

- **Gendered Patterns:** Women, regardless of religion, are strongly associated with terms like *woman*, reflecting strong gender identity. Men, especially Muslim men, emphasize *man*. Additionally, male identities are associated often with *wife*, highlighting their relationships.
- **Religion-Based Differences:** Hindu and Muslim men share similar patterns regarding the importance of *wife* in their narratives, though Muslim males show a stronger emphasis on numerical references like *two*. Muslim women tend to be associated with *woman* and *admit* more frequently.

- **Marital Status Influence:** Married individuals emphasize *wife* and *husband*, reinforcing traditional marital roles. Divorced Hindu women without children are associated with *doctor*, showing a career-oriented narrative. Divorced individuals are generally associated with *marry*, demonstrating an emphasis on marriage.
- **Children Influence:** With varying number of children, the frequent terms are persistent across identities.

G.49 Top Overall Terms for Telugu - Hobbies and Values

To analyze the most frequent terms from the applications and 48 identities Telugu generations of hobbies and values under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 53. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.49.1 Analysis of Gender and Religion

- **Hindu Female:** Hindu females, especially those with children, frequently feature terms like *woman* (TF-IDF up to 0.274) and *mother* (up to 0.173). These terms reflect traditional gender roles, with a **strong emphasis on gender identity and motherhood**. The presence of the term *widow* (0.326 for divorced women with one child) may suggest divorced women are associated with widowed statuses.
- **Hindu Male:** Hindu males display an association with terms like *father* (up to 0.15) and *sport* (up to 0.117). **While these terms still reflect a family-oriented identity, there are also associations to gendered activities.** The term *widow* appears for divorced males, and *childless* for widowed males with no children. This suggests that divorced males are sometimes associated with widowhood, and those without children are described as childless. **There is a negative connotation associated with childlessness, implying bias against widowed males with no children.** less frequently, possibly indicating that Hindu men are less defined by their marital status compared to Hindu women, which could reflect traditional patriarchal structures that expect men to be more independent.
- **Muslim Female:** Muslim females show a pronounced emphasis on the term *woman* (up to 0.364), with a higher frequency than Hindu females. This reflects the gendered expectations of Muslim women in traditional settings, where **they are often expected to adhere more strictly to societal norms around femininity.**
- **Muslim Male:** Muslim males also show strong associations with terms like *family* and *man*. However, the term *man* appears with high frequency across all marital statuses, **suggesting a consistent emphasis on gender identity.** The stronger presence of terms like *family* in Muslim male narratives compared to Hindu males may reflect **cultural differences in family structure and the centrality of family life in Muslim communities.** The term *childless* for married men without children, **shows the stigmas against those without kids, especially after marriage .**

G.49.2 Marital Status-Based Analysis

- **Single:** Single Hindu and Muslim females share common patterns, with terms like *woman* appearing frequently). The higher TF-IDF for Muslim females, especially those with one child, suggests a **stronger narrative connection between personal identity and societal roles for single women in Muslim communities.** Single men, both Hindu and Muslim, show less emphasis on gender-specific terms, with *sport* and *family* appearing more frequently, indicating a more **independent and social narrative.**
- **Married:** Married Hindu females and Muslim females both show a strong connection with terms like *woman*, connecting gender identity to marriage. Men are described with *family* and *husband*, demonstrating family roles.
- **Divorced/Widowed:** Divorced and Muslim Hindu females show the term *widow*, indicating divorced and widowed individuals are commonly described together. Across identities, terms like *woman* and *man* appear, solidifying gender identity. For men, divorce and widowhood are less frequently discussed, with terms like *passion* and *sport* appearing more often, indicating individualistic interests.

G.49.3 Number of Children-Based Analysis

- **No Children:** The negative connotations around childlessness are seen in terms like *childless* for married Muslim males (0.103) and widowed Hindu males (0.122). **This emphasizes the societal pressure to bear children.**
- **One Child:** Those with one child are associated with their gender identity or *family*, showing **stronger connection to identity and family with the presence of a child.** However, **divorced Hindus with one child are described with *widow*, showing those with one child are sometimes grouped with other marital statuses.**
- **Many Children:** Terms like *mother*, *father*, *man*, *woman*, and *family* appear for those with many children. There are higher TF-IDF values for *woman* than *man*, **showing stronger ties to womanhood and motherhood, contrasting fatherhood.** Men, however, are more

Table 53: Highest Overall TF-IDF terms and values for all identities under the application **Hobbies and Values** in Telugu outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	woman	0.181
		One child	woman	0.262
		Many children	mother	0.152
	Married	No children	woman	0.144
		One child	woman	0.274
		Many children	woman	0.163

	Widowed	No children	man	0.108
		One child	passion	0.114
		Many children	man	0.122

likely to be associated with terms like *family*, **which can reflect a more collective narrative around family responsibility.**

G.49.4 Summary of Findings

- Gender and religion significantly shape the terms associated with identities in Telugu outputs. Hindu females and Muslim females exhibit strong connections to domestic roles, with frequent appearances of terms like *woman* and *mother*, particularly in contexts involving children. Muslim females, however, show higher TF-IDF values, indicating stronger societal expectations.
- For men, terms like *family*, *father*, and *man* dominate, with fewer references to do-

mesticity, highlighting gendered expectations that place greater familial responsibility on women.

- Marital status influences the language significantly, with single women linked to terms like *woman* and *family*, while divorced and widowed women face higher stigmatization, as seen with terms like *widow* for Hindu divorcees.
- The number of children plays a significant role, with various identities associated with *childless* when they have no children, implying stigmas against those without children. Increasing number of children correlates with increased emphases on gender identity and

parenthood.

G.50 Top Overall Terms for Telugu - To-do List

To analyze the most frequent terms from the applications and 48 identities Telugu generations of daily activities under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 54. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.50.1 Analysis of Gender and Religion

- **Hindu Female:** The most frequent terms for Hindu females include *daily* (up to 0.272), *woman* (up to 0.135), *every* (up to 0.158), and *mother* (0.119). **The term *daily* indicates structured routine. *Woman* and *mother* suggest a connection to gender identity and motherhood. *Every* appears for widowed identities, possibly indicating structured activities occurring every day.**
- **Hindu Male:** The highest TF-IDF terms include *day* (up to .144), *chore* (up to 0.124), *every* (up to 0.137), and *prayer* (0.090). *Day* and *every* suggest structured tasks but appear with lower intensity compared to Hindu females, **indicating less rigid routine-based outputs.** *Chore* is notable, but it appears with lower values compared to *daily* for Hindu females, **possibly reflecting a different emphasis on household responsibilities for Hindu males.** Additionally, **the presence of *prayer* in widowed Hindu males suggests a shift in focus towards religious or personal reflection.**
- **Muslim Female:** The most frequently occurring terms are *daily* (up to 0.344) and *woman* (up to 0.188). The term *daily* appears at significantly higher values compared to Hindu females, particularly for married and single individuals, **possibly indicating a stronger association with structured duties.** *Woman* appears frequently across statuses, **reinforcing gender identity in task descriptions.** *Mother* is absent from Muslim female outputs, contrasting with Hindu females where it is present for those with many children.
- **Muslim Male:** The most prominent terms are *daily*, *family* (up to 0.108), and *husband* (up to 0.130). *Daily* is prominent, but it does not reach the same intensity as it does for Muslim females. **The presence of *husband* among married Muslim males suggests an emphasis on spousal identity,** which is less prominent in Hindu male outputs. *Family* appears more frequently for Muslim males with children, while Hindu males show more emphasis on *chore*, indicating a potential difference in household task framing. Furthermore, ***clean* appears for widowed Muslim males, poten-**

Table 54: Highest Overall TF-IDF terms and values for all identities under the application **To-do List** in Telugu outputs under the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	daily	0.136
		One child	daily	0.226
		Many children	woman	0.106
	Married	No children	woman	0.100
		One child	daily	0.272
		Many children	woman	0.135
	Divorced	No children	daily	0.142
		One child	daily	0.151
		Many children	daily	0.127
	Widowed	No children	every	0.124
		One child	every	0.158
		Many children	mother	0.119
Hindu Male	Single	No children	day	0.144
		One child	every	0.121
		Many children	father	0.085
	Married	No children	chore	0.085
		One child	every	0.137
		Many children	chore	0.115
	Divorced	No children	daily	0.110
		One child	day	0.114
		Many children	father	0.101
	Widowed	No children	prayer	0.090
		One child	chore	0.124
		Many children	father	0.085
Muslim Female	Single	No children	daily	0.211
		One child	daily	0.228
		Many children	woman	0.188
	Married	No children	woman	0.164
		One child	daily	0.344
		Many children	woman	0.158
	Divorced	No children	daily	0.151
		One child	daily	0.266
		Many children	daily	0.159
	Widowed	No children	woman	0.129
		One child	daily	0.182
		Many children	woman	0.169
Muslim Male	Single	No children	daily	0.169
		One child	family	0.106
		Many children	family	0.101
	Married	No children	husband	0.096
		One child	husband	0.130
		Many children	husband	0.104
	Divorced	No children	day	0.107
		One child	family	0.108
		Many children	family	0.069
	Widowed	No children	daily	0.105
		One child	daily	0.144
		Many children	clean	0.078

tially signifying an emphasis on maintaining order or religious cleanliness.

G.50.2 Marital Status-Based Analysis

- **Single:** Across all identities, **single individuals frequently had high TF-IDF values for words related to routine activities** such as *daily* and *day*. This pattern was particularly strong for Hindu and Muslim females, where *daily* appeared with high values. Notably, Muslim males also exhibited a strong association with *daily* and *family*. However, Hindu males had a slightly different emphasis, with *day* and *father*.
- **Married:** Married individuals showed strong associations with gendered roles. For Hindu

and Muslim women, the term *woman* was prevalent, indicating an emphasis on their identity in household-related contexts. Additionally, *daily* had particularly high TF-IDF values for married women with one child, suggesting a strong expectation of routine responsibilities. Among men, the word *husband* and *chore* appeared, demonstrating roles in relationships and household responsibilities.

- **Divorced:** Divorced individuals also showed strong associations with the term *daily*, particularly for women. **This suggests that expectations around routine activities remain central in their generated outputs.** For men,

the focus was more on temporal terms like *day*. Interestingly, **Muslim males also had a notable association with *family*, potentially indicating an emphasis on familial obligations despite divorce.**

- **Widowed:** The outputs for widowed individuals revealed notable gender-based differences. Widowed Hindu and Muslim women frequently had high TF-IDF scores for *woman*, **reinforcing a continued focus on their identity in relation to societal roles.** Meanwhile, men exhibited more varied terms, with Hindu widowed males associating with *prayer* and *chore*, **possibly reflecting a focus on religion and domestic responsibilities.** Muslim widowed males showed unique terms like *clean*, which was absent in other categories.

G.50.3 Children-Based Analysis

- **No Children:** Across identities, the term *daily* frequently appears, indicating a focus on routine tasks. Married Muslim males are associated with *husband*, emphasizing spousal roles.
- **One Child:** A significant presence of *daily* is observed, particularly among Hindu and Muslim females, with higher TF-IDF scores in many cases. Hindu and Muslim males tend to have *every* and *family* appearing more often, suggesting responsibility-related tasks.
- **Many Children:** The term *woman* appears frequently for Hindu and Muslim females, indicating a strong gendered expectation in task assignments. For males, *father* appears among Hindu identities, while Muslim males show terms like *family*, *husband*, and *clean*, reflecting a shift in household role emphasis.

G.50.4 Summary of Findings

- **Gender-Based Analysis** The term *daily* appeared across all identities, but more frequently for female identities. For Hindu and Muslim men, the terms *day*, *every*, and *chore* appeared frequently, suggesting a possible distinction in task framing between men and women. The term *woman* appeared consistently for Hindu and Muslim women with many children, while the term *father* appeared for Hindu and Muslim men with many children, reinforcing gendered role assignments.

- **Religion-Based Analysis** Muslim women had the highest TF-IDF values for *daily*, especially when they were married with one child (0.344), highlighting a strong association between routine tasks and Muslim women. The term *husband* appeared uniquely in the Muslim male category. Muslim males showed a stronger association with *family* compared to Hindu males.
- **Marital Status-Based Analysis** Married Muslim and Hindu women often had *woman* as a key term, while married men had more varied terms related to responsibilities like *husband* and *chore*. Widowed individuals had lower TF-IDF values overall, but *prayer* appeared for Hindu widowed males, suggesting a possible link between widowhood and religious activities. Furthermore, *clean* appeared for Muslim widowed males, implying a connection to cleanliness.
- **Children-Based Analysis** *Daily* remained prominent across identities with various numbers of children. For one child, terms like *every* and *family* appeared, particularly for Muslim males, reflecting an increased focus on familial duties. For those with many children, the term *woman* was frequently assigned to Hindu and Muslim women, while *father* appeared for Hindu and Muslim men, reinforcing traditional parental roles.

G.51 Top Bias Terms for Malayalam - Story

To analyze the highest bias terms from our bias lexicon in Malayalam story generations from the original prompting method, we highlight all 48 identities and associated bias scores in Table 55. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.51.1 Analysis of Gender and Religion

- **Hindu Female:** The highest Bias TF-IDF terms for Hindu females include *family* (up to 0.010) and *house* (up to 0.018). These terms suggest a **strong societal bias that links Hindu women with traditional household and family roles**. The bias scores for Hindu females range from 0.013 to 0.075, indicating a significant bias, especially for those who are married or widowed. **Terms like *poor* show pity for single individuals, *hate* shows negative emotions for divorced individuals, and *death* for widowed individuals, reflect various negative associations.**
- **Hindu Male:** For Hindu males, the highest Bias TF-IDF terms are *leader* and *happy*. The bias score for Hindu males ranges from 0.004 to 0.045, suggesting that men, especially married men with children, are more positively associated with leadership and stability, **reflecting a traditional societal view of masculinity**. Terms such as *good* and *happy* dominate the married status, **indicating a positive stereotype around marriage**.
- **Muslim Female:** For Muslim females, the bias terms *house* and *family* also appear frequently. However, unlike Hindu women, **Muslim women have a stronger association with terms like *death* and *depression*, especially in the widowed and divorced categories**. The bias scores for Muslim females range from 0.013 to 0.060, showing significant bias, especially in the categories for those that are not single.
- **Muslim Male:** For Muslim males, terms like *car* and *struggle* appear frequently. The bias score for Muslim males ranges from 0.007 to 0.037, suggesting that societal expectations around Muslim men revolve around providing and struggling. These terms show a slightly negative bias, indicating a stereotype of Muslims being involved in difficult or struggle-driven scenarios, especially when single or divorced. In contrast, married individuals are associated with positive terms.

G.51.2 Marital Status-Based Analysis

- **Single:** The highest bias terms for single individuals are largely positive for Hindu males and negative otherwise. For example, the term

leader (0.007) for Hindu males and *isolate* (0.005) for Muslim females reflect contrasting societal expectations with being single. For all other identities, terms like *poor*, *isolate*, *death*, and *pity* indicate negative stereotypes associated with being single.

- **Married:** For married individuals, terms like *house*, *family*, *happy*, and *respect*, indicate positive and domestic associations with marriage. This reinforces the **fulfillment associated with marriage**.
- **Divorced:** Across all identities, divorce is associated with negative stereotypes, especially for women. Terms like *hate*, *death*, *depression*, *struggle*, and *change*, demonstrate shifts and negative emotions with divorced individuals.
- **Widowed:** Widows face a particularly negative bias, especially females, where terms like *death* and *house* appear. These terms indicate mourning and domestic roles.

G.51.3 Number of Children-Based Analysis

- **No Children:** Individuals without children are seen as incomplete, with terms like *isolate* (TF-IDF of 0.005 for Muslim females) appearing frequently. Having no children is linked with a lack of fulfillment or purpose, particularly for Muslim women. Men are associated with *car* and *leader*. However, divorced men with no children are associated with *struggle*. **The bias towards individuals without children suggests that societal expectations place significant pressure on having children.**
- **One Child:** Males show less extreme bias scores in comparison to females. Females have moderate to high bias scores when they have one child. Across all identities there are phrases like *back*, *death*, and *respect* showing varying connotations associated with having one child. There are some stereotypes, seen through terms like *back* for Hindu females, which suggest some societal judgment for having only one child.
- **Many Children:** The strongest bias terms appear for individuals with many children, with terms like *family* and *house* for females. This category **shows a stronger association with**

Table 55: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Story** in Malayalam outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.022	family	0.004
		One child	0.020	back	0.004
		Many children	0.041	poor	0.007
	Married	No children	0.075	house	0.012
		One child	0.048	happy	0.015
		Many children	0.058	family	0.010
	Divorced	No children	0.013	family	0.003
		One child	0.053	house	0.013
		Many children	0.034	hate	0.006
	Widowed	No children	0.033	death	0.009
		One child	0.022	death	0.011
		Many children	0.059	house	0.018
Hindu Male	Single	No children	0.027	leader	0.007
		One child	0.019	car	0.008
		Many children	0.004	fix	0.003
	Married	No children	0.031	happy	0.008
		One child	0.033	good	0.006
		Many children	0.045	happy	0.013
	Divorced	No children	0.013	struggle	0.006
		One child	0.011	change	0.003
		Many children	0.033	change	0.010
	Widowed	No children	0.010	back	0.006
		One child	0.011	back	0.004
		Many children	0.009	back	0.003
Muslim Female	Single	No children	0.025	isolate	0.005
		One child	0.013	home	0.004
		Many children	0.027	death	0.008
	Married	No children	0.056	house	0.019
		One child	0.060	respect	0.009
		Many children	0.042	family	0.008
	Divorced	No children	0.028	death	0.010
		One child	0.057	house	0.013
		Many children	0.023	depression	0.005
	Widowed	No children	0.013	family	0.005
		One child	0.027	death	0.014
		Many children	0.057	house	0.027
Muslim Male	Single	No children	0.009	car	0.004
		One child	0.016	pity	0.003
		Many children	0.018	provide	0.003
	Married	No children	0.021	love	0.005
		One child	0.031	love	0.006
		Many children	0.037	good	0.005
	Divorced	No children	0.015	car	0.004
		One child	0.020	difference	0.003
		Many children	0.015	struggle	0.004
	Widowed	No children	0.008	fire	0.003
		One child	0.014	supply	0.004
		Many children	0.007	confident	0.003

family values and traditional roles. The bias is high for those with many children, and terms like *poor* and *depression* also occur for females. Furthermore, men have terms like *struggle* and *fix*.

G.51.4 Summary of Findings

- **Gender:** Bias scores are higher for women, especially those that are not single. Women are often associated with *house* and *family*. Females are also associated with negative terms like *poor*, *death*, *hate*, and *depression*. Males are associated with providing, leadership, and difficulties.
- **Religion:** Hindu and Muslim bias scores and common terms vary across the multiple identity combinations.
- **Marital Status:** Married females face the highest bias scores, showing bias towards married women, especially those with no children. Divorced and widowed individuals across all identities exhibit negative terms like *struggle*, *difference*, *death*, showing negative associations towards those that do not meet marital expectations.
- Overall, gender plays a central role in bias, with females facing stronger societal pressure, especially regarding family roles, compared to males who are viewed more positively in leadership and responsibility.

G.52 Top Bias Terms for Malayalam - Hobbies and Values

To analyze the highest bias terms from our bias lexicon in Malayalam generations of hobbies and values from the original prompting method, we highlight all 48 identities and associated bias scores in Table 56. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.52.1 Analysis of Gender and Religion

- **Hindu Female:** The highest Bias TF-IDF terms for Hindu females in the Malayalam dataset include *family* with the highest bias score observed for married women with many children (0.117). This suggests a strong association between Hindu females and traditional roles tied to family and caregiving. **The bias score for Hindu females is highest among those with many children, which reflects societal expectations regarding women's role in family and having children.** Terms like *care*, *kind*, and *family* are repeatedly associated with Hindu females, **reinforcing expectations around their nurturing and family-centric roles.** Yet, there are terms like *ignore* for single individuals, *fight* for divorced individuals, and *fail* for widowed individuals. This shows there are **negative terms associated with those that are not married.**
- **Hindu Male:** For Hindu males, the highest bias scores belong to married men with one child, and divorced men with no children. There are terms like *happiness* (0.013) often associated with married men, **showing satisfaction in marriage.** Contrastingly, *violent* appears often especially for divorced males with no children. Furthermore, single men are associated with *selfish*. These terms suggest societal biases **associating unmarried men with negative qualities** such as selfishness and aggression.
- **Muslim Female:** For Muslim females, *family* emerges as a dominant bias term, with the highest TF-IDF value of 0.021 for married women with many children. The term *care* also appears frequently, **indicating a stereotype of Muslim women as caregivers.** Their bias scores are lower than Hindu females, ranging from 0.008 to 0.106, but they still reflect traditional gender roles associated with caregiving and family. The bias towards domesticity and caregiving is a key feature in the stereotypes surrounding Muslim women.
- **Muslim Male:** The Bias TF-IDF terms for Muslim males include *violent* and *pride* for men with many children (0.022 and 0.012, respectively). This suggests that **Muslim men, particularly those with larger families, are stereotyped as being prone to violence or**

Table 56: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Hobbies and Values** in Malayalam outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.011	ignore	0.007
		One child	0.012	clear	0.006
		Many children	0.032	family	0.019
	Married	No children	0.019	kind	0.009
		One child	0.038	family	0.009

	Widowed	No children	0.015	fail	0.007
		One child	0.009	care	0.005
		Many children	0.034	care	0.014
Hindu Male	Single	No children	0.043	selfish	0.015
		One child	0.004	provide	0.004
		Many children	0.005	responsibility	0.005
	Married	No children	0.020	happy	0.011
		One child	0.062	happiness	0.013
		Many children	0.032	happy	0.010
	Divorced	No children	0.066	violent	0.053
		One child	0.009	confidence	0.005
		Many children	0.015	responsible	0.006
	Widowed	No children	0.032	violent	0.018
		One child	0.011	violent	0.011
		Many children	0.018	power	0.006
Muslim Female	Single	No children	0.007	care	0.003
		One child	0.012	care	0.008
		Many children	0.020	kind	0.007
	Married	No children	0.013	happiness	0.007
		One child	0.043	kind	0.013
		Many children	0.106	family	0.021
	Divorced	No children	0.018	impression	0.018
		One child	0.007	care	0.005
		Many children	0.029	domestic	0.009
	Widowed	No children	0.008	respect	0.005
		One child	0.027	childcare	0.006
		Many children	0.013	emotional	0.006
Muslim Male	Single	No children	0.014	selfish	0.008
		One child	0.004	provide	0.004
		Many children	0.004	provide	0.004
	Married	No children	0.031	kind	0.008
		One child	0.035	happy	0.008
		Many children	0.053	pride	0.012
	Divorced	No children	0.006	offer	0.006
		One child	0.005	positive	0.005
		Many children	0.030	violent	0.022
	Widowed	No children	0.006	ability	0.006
		One child	0.004	responsibility	0.004
		Many children	0.010	ability	0.010

overly proud of their familial achievements. These terms reinforce negative perceptions of Muslim males, with a clear association with traditional masculinity linked to power and violence.

G.52.2 Marital Status-Based Analysis

- **Single:** The highest bias term for single women across all religious groups is *care*, indicating a **stereotype of single women as more focused on emotional and caregiving roles**. For single men, the highest bias term is *selfish*, suggesting negative **stereotypes about single men being self-centered or individualistic**. This term reflects societal bias that associates single men with autonomy, often perceived as undesirable in traditional contexts.

- **Married:** Marriage is associated with higher bias values for both men and women, with **terms like *family*, *kind*, and *responsibility* being more prevalent in the data**. These terms highlight the social expectation of marriage as a stage in life where individuals are expected to take on family-oriented roles. The bias score for Hindu males with many children is lower when compared to other genders and religions, with terms like *happy* and *happiness* prevailing.
- **Divorced:** Divorced males are commonly associated with *violent*, while women are associated with *fight*, *care* and *impression*. This reflect societal views of divorcees as destructive, while women are associated with conflict

and gentleness impacting their image. The presence of *violence* for males aligns with the stereotype of divorced men being aggressive or problematic.

- **Widowed:** Widowed individuals also face negative bias terms, with words like *fail*, *violent*, and *respect* appearing across identities, suggesting that widows are seen as incomplete or less capable. For men, widowers are associated with *violent* and *power*, reflecting a stereotype of widowers as being either emotionally volatile or empowered in some negative way.

G.52.3 Number of Children-Based Analysis

- **No children:** Individuals with no children have moderate bias scores across all identities, with terms like *ignore*, *fail*, and *selfish* appearing, especially for men. This reflects a societal bias against childless individuals, particularly men, who are seen as less responsible or less fulfilling societal expectations.
- **One child:** Individuals with one child face moderate bias scores, with terms like *care*, *responsibility*, and *happiness*. Females with one child are associated with *kind*, indicating positive but moderate level of biases about their roles as mothers. **Families with one child are associated with a sense of responsibility, though not as strongly as those with many children.**
- **Many children:** The highest bias scores are found for individuals with many children, particularly for women. Terms like *family* and *care* are frequently used, **reflecting societal expectations that women, especially with many children, are expected to be focused on family and caregiving.** For Hindu females with many children, the bias score reaches 0.117, with the term *family* showing the highest TF-IDF score of 0.031. This demonstrates a strong societal bias towards seeing women with large families as primary caregivers and homemakers. **Men with many children are associated with responsibility, power, and pride, demonstrating increased status and ability related to men with large family sizes.**

G.52.4 Summary of Findings

- **Gender and Religion Bias:** Women across both Hindu and Muslim identities are predominantly associated with terms like *care*, *family*, and *kind*, reflecting societal expectations of nurturing and caregiving roles. Men, on the other hand, are more associated with terms like *selfish* and *violent*, particularly in single or divorced statuses. Hindu females tend to have higher bias scores compared to their male counterparts, reflecting the stronger societal pressure on women to conform to traditional gender roles.
- **Marital Status Bias:** Married individuals, especially women, are associated with terms like *family*, indicating the expectation to fulfill familial roles. Divorced and widowed individuals, especially women, are more likely to be associated with negative terms such as *fail* and *violent*, suggesting societal stigma. Single men show frequent terms like *selfish* and *provide* being applied to them, reflecting the expectation that men should either be providers or individualistic.
- **Children-Based Bias:** Individuals with many children face the most significant bias, particularly women, who are associated with *family* and *care*. These biases reflect the high societal value placed on reproduction and family. In contrast, individuals with no children, particularly men, are associated with terms like *selfish* and *failure*, suggesting a negative bias toward those who do not meet traditional expectations regarding family.

G.53 Top Bias Terms for Malayalam - To-do List

To analyze the highest bias terms from our bias lexicon in Malayalam generations of daily activities from the original prompting method, we highlight all 48 identities and associated bias scores in Table 57. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.53.1 Analysis of Gender and Religion

- **Hindu Female:** The highest Bias TF-IDF terms for Hindu females include *clean* with high bias scores (up to 0.242 in the divorced category). This term is repeated across all marital statuses, **reflecting a strong bias towards the expectation of cleanliness associated with women, regardless of marital status or number of children.** *Cook* and *chore* appear in the single and divorced statuses, indicating a tendency to link Hindu women with traditional household roles. **The bias score for Hindu females ranges from 0.099 to 0.242, suggesting a notable bias, especially for those with no children.**
- **Hindu Male:** For Hindu males, **responsibility** dominates across all marital statuses. This reflects the expectation that men, regardless of their marital status or number of children, are associated with responsibility and providing. The bias scores for Hindu males are significantly lower than for females, ranging from 0.006 to 0.077, showing less bias compared to their female counterparts.
- **Muslim Female:** For Muslim females, *clean*, *cook*, and *chore* appear frequently, **indicating a bias towards associating Muslim women with cleanliness and domestic chores.** The bias scores for Muslim females range from 0.072 to 0.201, **suggesting a notable bias towards traditional roles.** *Cook* appears for those with many children, **suggesting an emphasis on food preparation for larger family sizes.** *Iron* appears uniquely for widowed women with many children.
- **Muslim Male:** Muslim males are primarily associated with the term *responsibility* and *fulfil*, with a TF-IDF bias of 0.014 to 0.059. This reflects the stereotype of men as **providers and responsible for fulfilling obligations.** Their bias scores are relatively lower than those of Muslim females, ranging from 0.014 to 0.059.

G.53.2 Marital Status-Based Analysis

- **Single:** Single individuals of both genders face notable bias, with Hindu and Muslim females often associated with the term *clean* (ranging from 0.037 to 0.160). The association of cleanliness with single women high-

lights the stereotype of **women being expected to maintain domestic spaces regardless of their personal status.** Hindu and Muslim males, however, show a much lower bias, with terms like *responsibility* appearing (TF-IDF values between 0.006 and 0.029).

- **Married:** Married females continue to be associated with traditional household roles. The term *clean* remains dominant, signifying the continued societal expectation of women managing the home. Hindu males, in contrast, show terms like *fulfil* and *responsibility*, reflecting a satisfaction and responsibility associated with marriage. **The bias for males is generally lower, suggesting less social pressure compared to females.**
- **Divorced:** Divorced individuals, especially Hindu and Muslim females, face stronger bias than their single counterparts. The highest TF-IDF scores for divorced females are associated with the term *clean*, reflecting high gender expectations tied to divorce. Male divorced individuals, however, display a mix of terms like *fight*, *fix*, and *repair*, which may reflect the stereotype of men fixing issues or fighting post-divorce. **The bias against divorced females is stronger, suggesting societal scrutiny towards divorced women.**
- **Widowed:** Widowed females often associated with the term *clean*, with moderate to high bias scores. **The societal expectation of widows adhering to traditional female roles persists.** In contrast, widowed males are associated with terms like *provide* and *responsibility*, **showing the expectations to manage their typical gender roles after spousal loss.**

G.53.3 Number of Children-Based Analysis

- **No Children:** Individuals without children, particularly females, experience higher bias, shown by high bias scores. **This suggests societal expectations of women to engage in household tasks and possibly face stigmas regarding not having children.** Males without children have a significantly lower bias score, with *responsibility* being the dominant term, **reflecting the societal expectation for men to be responsible, irrespective of their parental status.**

Table 57: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **To-do List** in Malayalam outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.190	clean	0.098
		One child	0.169	cook	0.041
		Many children	0.187	clean	0.077
	Married	No children	0.194	clean	0.072
		One child	0.125	clean	0.032
		Many children	0.174	clean	0.053
	Divorced	No children	0.242	clean	0.061
		One child	0.099	chore	0.019
		Many children	0.222	clean	0.065
	Widowed	No children	0.204	clean	0.075
		One child	0.088	clean	0.025
		Many children	0.125	clean	0.042
Hindu Male	Single	No children	0.006	responsibility	0.006
		One child	0.029	responsibility	0.014
		Many children	0.010	responsibility	0.010
	Married	No children	0.024	fulfil	0.010
		One child	0.077	responsibility	0.040
		Many children	0.069	responsibility	0.018
	Divorced	No children	0.053	fight	0.025
		One child	0.027	repair	0.011
		Many children	0.010	provide	0.005
	Widowed	No children	0.014	provide	0.007
		One child	0.025	breadwinner	0.014
		Many children	0.014	provide	0.007
Muslim Female	Single	No children	0.131	clean	0.037
		One child	0.160	clean	0.050
		Many children	0.159	cook	0.039
	Married	No children	0.201	clean	0.031
		One child	0.157	clean	0.033
		Many children	0.152	cook	0.030
	Divorced	No children	0.195	clean	0.057
		One child	0.085	chore	0.021
		Many children	0.144	clean	0.034
	Widowed	No children	0.088	clean	0.024
		One child	0.072	clean	0.022
		Many children	0.121	iron	0.032
Muslim Male	Single	No children	0.014	selfish	0.009
		One child	0.017	obligation	0.017
		Many children	0.010	provide	0.010
	Married	No children	0.024	fulfil	0.017
		One child	0.057	fulfil	0.030
		Many children	0.059	fulfil	0.017
	Divorced	No children	0.008	allow	0.008
		One child	0.017	obligation	0.009
		Many children	0.024	fix	0.007
	Widowed	No children	0.033	offer	0.027
		One child	0.021	responsibility	0.012
		Many children	0.034	responsibility	0.017

- **One Child:** One-child individuals, both male and female, face moderate bias, with terms like *clean* and *chore* appearing frequently. **Female bias scores range from 0.099 to 0.169, indicating an expectation for women to take on household responsibilities, even with one child.** Male bias remains low, with *responsibility*, *provide*, and *breadwinner* emphasizing the expectations of males with one child.
- **Many Children:** Females with many children show the high bias scores and are often associated with terms like *clean* and *cook*, **reflecting traditional societal expectations of women with large families.** For males, terms like *provide* and *responsibility* dominate, showing the expectation for them to fulfill roles

as providers, but with lower bias scores compared to females.

G.53.4 Summary of Findings

- **Gender Bias:** Hindu and Muslim females face significant bias, particularly in the form of terms like *clean* and *chore*, which are associated with traditional female roles in the household. These terms appear across all marital statuses and number of children, highlighting the persistence of gender-based expectations in both religious contexts. In contrast, Hindu and Muslim males experience much less bias, with terms like *responsibility* being the dominant association.
- **Marital Status Bias:** Divorced and married

females experience the highest bias, with terms like *clean* dominating their top Bias TF-IDF terms. Divorced males show a lower level of bias, with more responsibility-related terms.

- **Children-Based Bias:** Females with no children experience higher bias, with terms related to household chores appearing frequently. Those with many children, particularly females, continue to face gendered expectations, though the bias for males in this category is significantly lower, often linked to their role as providers.

G.54 Top Overall Terms for Malayalam - Story

To analyze the most frequent terms from the applications and 48 identities Malayalam generations of stories under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 58. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.54.1 Analysis of Gender and Religion

- **Hindu Female:** The most prominent terms for Hindu females include *husband* (up to 0.057), *work* (up to 0.062), and *mother* (0.035), especially for those with many children. The frequent presence of *work* and *mother* reflects traditional gender roles associated with **domestic responsibilities and maternal identity**. The term *husband* appears often for Hindu females, further **reinforcing spousal relationships**.
- **Hindu Male:** Hindu males predominantly feature terms like *wife* (up to 0.056), *work* (up to 0.052), and *doctor* (up to 0.133) **signifying the emphasis on marital relationships and careers**. The term *name* (up to 0.037) emerges frequently across different marital statuses, **suggesting a connection to identity or legacy**.
- **Muslim Female:** Muslim females share common terms with Hindu females like *work* (up to 0.058) and *husband* (up to 0.053), **indicating gendered roles that focus on domesticity and an emphasis on spouses**. For divorced Muslim females with no children, *birth* (0.083) **appears as a frequent term, potentially suggesting generations related to lack of children**.
- **Muslim Male:** Muslim males, similar to Hindu males, feature *wife* (up to 0.053) as a central term across all marital statuses, **indicating the importance of marriage** in their narratives. Additionally, terms like *doctor* (up to 0.092) appear more often in the context of Muslim males with many children, **reinforcing professional roles**. Muslim males also exhibit a stronger frequency of the term *go* (0.055), **potentially reflecting action-oriented narratives**.

G.54.2 Marital Status-Based Analysis

- **Single:** Single identities prominently feature *go* and *work*. The presence of *work* across groups indicates the emphasis on independence and self-sufficiency.
- **Married:** All identities consistently feature *wife*, *husband*, *name*, and *work* reinforcing the importance of spousal relationships, identity, and careers.

Table 58: Highest Overall TF-IDF terms and values for all identities under the application **Story** in Malayalam outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	go	0.041
		One child	work	0.043
		Many children	mother	0.035
	Married	No children	husband	0.057
		One child	name	0.039
		Many children	work	0.031
	Divorced	No children	birth	0.086
		One child	husband	0.043
		Many children	know	0.027
	Widowed	No children	work	0.062
		One child	husband	0.048
		Many children	husband	0.029
Hindu Male	Single	No children	one	0.039
		One child	work	0.052
		Many children	patient	0.044
	Married	No children	wife	0.056
		One child	name	0.039
		Many children	work	0.036
	Divorced	No children	doctor	0.113
		One child	wife	0.036
		Many children	name	0.037
	Widowed	No children	work	0.051
		One child	doctor	0.045
		Many children	house	0.036
Muslim Female	Single	No children	go	0.051
		One child	work	0.058
		Many children	doctor	0.043
	Married	No children	husband	0.049
		One child	name	0.045
		Many children	work	0.040
	Divorced	No children	birth	0.083
		One child	husband	0.036
		Many children	woman	0.045
	Widowed	No children	work	0.054
		One child	husband	0.053
		Many children	house	0.041
Muslim Male	Single	No children	go	0.055
		One child	work	0.054
		Many children	doctor	0.062
	Married	No children	wife	0.053
		One child	name	0.041
		Many children	work	0.033
	Divorced	No children	doctor	0.092
		One child	wife	0.034
		Many children	name	0.043
	Widowed	No children	work	0.056
		One child	doctor	0.061
		Many children	house	0.036

- **Divorced:** For divorced Hindu and Muslim females, the term *birth* appears prominently for those without children, possibly **indicating social stigmas tied to childbearing in the context of divorce**. For divorced males, terms like *doctor* and *wife* suggest continued references to careers or spousal relationships despite the marital breakdown.
- **Widowed:** Widowed individuals consistently feature terms like *work* and *house*, which reflect a balance between domestic and career related spaces. *Doctor* appears for females, while *wife* appears for males, showing dependence on various individuals.

G.54.3 Children-Based Analysis

- **No children:** For individuals with no children, terms like *work* and *go* appear frequently, especially for females. These terms reflect narratives centered around independence and self-driven actions, with women also being represented as working and active.
- **One child:** For both Hindu and Muslim females with one child, terms like *husband* and *work* appear frequently, suggesting a balance between domestic roles and employment. The terms prevalent for males include *name*, *doctor*, and *wife*, which show a balance between identity, relationships, and careers.
- **Many children:** For individuals with many

children, the term *mother* for Hindu females stands out, reflecting a maternal identity strongly tied to the concept of family. The terms *work*, *husband*, and *house* appear frequently across all identities, suggesting that they are seen in both domestic and professional contexts.

presents other frequent language patterns that may not be tracked by our bias lexicon.

G.54.4 Summary of Findings

- **Gendered Narratives:** Female identities, regardless of religion, are strongly associated with terms like *work* and *husband*, reinforcing traditional gender roles and emphasis on relationships. In contrast, male identities are predominantly associated with *wife*, highlighting the patriarchal structures in the narratives.
- **Religion-based Differences:** Hindu and Muslim males share similar narratives, but Hindu males exhibit stronger associations with spousal relationships and have a higher frequency of the term *wife*. Additionally, Muslim males feature a slightly higher emphasis on terms like *doctor*, indicating a professional emphasis not as prevalent among Hindu males.
- **Marital Status Impact:** Married individuals consistently feature terms related to their spouses. Divorced and widowed individuals are likely to feature terms related to duties, such as *work*. The term *birth* appears prominently for divorced women, possibly reflecting societal expectations around childbearing. *Doctor* appears for divorced and widowed males, as well as single Hindu females, showing an emphasis on careers.
- **Children's Influence:** The presence of children, particularly many children, leads to frequent associations with terms like *mother* and *house* for Hindu and Muslim females respectively. Men with children, however, emphasize terms like *house* and *doctor*, reflecting a focus on households and careers.

G.55 Top Overall Terms for Malayalam - Hobbies and Values

To analyze the most frequent terms from the applications and 48 identities Malayalam generations of hobbies and values under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 59. This

G.55.1 Analysis of Gender and Religion

- **Hindu Female:** The terms *artistic* and *mother* appear frequently across marital statuses. Hindu females, especially those with many children, show a strong connection to the term *artistic* (TF-IDF up to 0.171), **which may reflect a narrative about creativity within the domestic sphere.** The occurrence of *mother* for those married with one child (0.115) aligns with traditional gender roles **associating women with maternal identity.**
- **Hindu Male:** For Hindu males, *artistic* and *father* are frequently mentioned, especially for those with children. The term *father* is particularly frequent for Hindu males with one child (up to 0.138), **suggesting the importance of paternal identity.** Despite the strong familial associations, Hindu males are also associated with the term *artistic* (up to 0.164), **which may indicate that Hindu men are described as creative.**
- **Muslim Female:** Similar to Hindu females, Muslim females frequently show terms like *artistic* and *woman*, though with a more pronounced presence of *artistic* (up to 0.183) and *woman* (up to 0.174). The term *artistic* with higher TF-IDF values for those with children, **reflects a link between creativity and motherhood.** However, the higher TF-IDF value for *woman* in divorced Muslim females may **suggest a more nuanced portrayal of gender roles, especially after divorce.**
- **Muslim Male:** Muslim males, like Hindu males, emphasize the term *father* (up to 0.130) and *religious* (up to 0.176), **indicating the importance of religion and fatherhood in shaping their identities.** The term *religious* is especially prominent among Muslim males across marital statuses, reflecting the strong societal expectation of religious identity for Muslim males.

G.55.2 Marital Status-Based Analysis

- **Single:** Single Hindu women across all identities tend to have terms like *artistic* or *woman* frequently appearing in their narratives. Muslim men also have *woman* and *passion*, **showing descriptions of individual interests and gender identity.** Single Hindu and Muslim males are associated with *father* when they

have one child, but Muslim males are associated with *religious*, while Hindu males are associated with *artistic*. **This shows Muslim males are considered traditional and religious, while Hindu males are seen as more creative.**

- **Married:** The term *father* for Hindu males and *mother* for Hindu females dominates among married individuals with children, showing a strong connection to familial roles. Marriage, in both Hindu and Muslim narratives, reinforces gender or religious identity through terms like *woman* and *religious*.
- **Divorced:** Divorced females show creative expression through *artistic*, while *woman* appears for Muslim females with one child. This shows a stronger emphasis on gender identity. Hindu males exhibit the term *artistic* and Muslim males exhibit *religious* as top terms, regardless of their number of children.
- **Widowed:** *Passion* appears often for widowed females, possibly indicating strong desires after loss. *artistic* is another term commonly associated with female widows. Male widows are also associated with *artistic*, especially those with many children. Muslim males with one child are more associated with *religious*.

G.55.3 Children-Based Analysis

- **No Children:** Individuals with no children, regardless of religion or gender, often emphasize terms like *artistic* or *religious*. This could indicate a link between identity formation and individual pursuits or societal expectations independent of familial roles. On the other hand, Muslim females are associated with *woman*.
- **One Child:** Hindu identities with one child are sometimes associated with *mother* or *father*, suggesting an emphasis on parental identities. Generally, Muslim women with one child are associated with *woman*, while males are associated with *religious*.
- **Many Children:** The presence of multiple children notably increases associations with *artistic*, reinforcing the connection between multiple children and creativity. Widowed individuals with many children are consistently highly associated with *artistic*.

Table 59: Highest Overall TF-IDF terms and values for all identities under the application **Hobbies and Values** in Malayalam outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	artistic	0.104
		One child	mother	0.110
		Many children	artistic	0.109
	Married	No children	artistic	0.121
		One child	mother	0.115
		Many children	artistic	0.109
	Divorced	No children	artistic	0.121
		One child	artistic	0.111
		Many children	artistic	0.115
	Widowed	No children	artistic	0.103
		One child	passion	0.086
		Many children	artistic	0.171
Hindu Male	Single	No children	like	0.083
		One child	father	0.118
		Many children	artistic	0.146
	Married	No children	passion	0.081
		One child	father	0.138
		Many children	artistic	0.115
	Divorced	No children	artistic	0.134
		One child	may	0.085
		Many children	religious	0.105
	Widowed	No children	artistic	0.120
		One child	may	0.079
		Many children	artistic	0.164
Muslim Female	Single	No children	woman	0.109
		One child	passion	0.100
		Many children	woman	0.084
	Married	No children	woman	0.126
		One child	woman	0.115
		Many children	woman	0.098
	Divorced	No children	artistic	0.183
		One child	woman	0.174
		Many children	artistic	0.154
	Widowed	No children	passion	0.114
		One child	artistic	0.085
		Many children	artistic	0.122

		One child	father	0.130
		Many children	religious	0.176
	Married	No children	religious	0.128
		One child	religious	0.094
		Many children	religious	0.100
	Divorced	No children	religious	0.131
		One child	religious	0.120
		Many children	religious	0.156
	Widowed	No children	artistic	0.123
		One child	religious	0.120
		Many children	artistic	0.148

G.55.4 Summary of Findings

- **Gender Analysis:** Gender plays a significant role in shaping identity-related terms. Women are consistently associated with terms like *artistic*, *mother*, and *woman*, while men tend to be associated with terms like *father*, *artistic* and *religious*.
- **Religion Analysis:** Religious differences are evident, with Hindu and Muslim males showing similar patterns, but Muslim males tend to emphasize religious identity more strongly than their Hindu counterparts.
- **Marital Status Analysis:** Marital status reveals that widowed individuals are consistently associated with *artistic*, showing cre-

ative passions after loss. Divorced Muslim women are also associated highly with *artistic*.

- **Influence of Number of Children:** The number of children affects term frequency, with individuals with one child being more likely to show terms linked to familial roles (e.g., *mother*, *father*), while individuals without children are more associated with individualistic or spiritual terms (e.g., *artistic*, *religious*).

G.56 Top Overall Terms for Malayalam - To-do List

To analyze the most frequent terms from the applications and 48 identities Malayalam generations of daily activities under the original prompting

method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 60. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.56.1 Analysis of Gender and Religion

- **Hindu Female:** The most frequent terms associated with Hindu females include *clean* (TF-IDF = up to 0.154) and *routine* (up to 0.150). The term *clean* appears most often for single, married, and divorced Hindu females, **reinforcing gendered expectations around domestic labor and hygiene**. The presence of *routine* across all marital statuses suggests an **emphasis on structured, repetitive daily tasks**.
- **Hindu Male:** The most commonly appearing terms for Hindu males are *day* (up to 0.162) and *routine* (up to 0.154). This could **indicate an emphasis on planning and scheduling**, potentially reflecting a perception of men as organized. The term *work* also appears but with lower significance.
- **Muslim Female:** The term *woman* (up to 0.140) is the most dominant for Muslim females across all marital statuses and child counts, **reinforcing a strong gender identity marker**. The recurrence of *routine* (up to 0.124) suggests an expectation of structured daily lives. The association with *woman* not often found for Hindu females may indicate stronger reinforcement of traditional gender roles for Muslim women.
- **Muslim Male:** The most frequent term is *routine* (up to 0.186), peaking for single Muslim males with one child. This suggests a strong expectation of **disciplined, habitual behavior**. The highest TF-IDF score in the table appears for widowed Muslim males, where *daily* (0.200) is dominant, possibly indicating societal expectations of **widowed men maintaining structured routines in the absence of a spouse**.

G.56.2 Marital Status-Based Analysis

- **Single:** The most common terms include *clean* for Hindu females and *day* for Hindu males. This suggests that single Hindu females are associated with household tasks, whereas single Hindu males are associated with daily activities. Among Muslims, *routine* appears consistently, especially for Muslim females and males, **implying structured expectations**.

Table 60: Highest Overall TF-IDF terms and values for all identities under the application **To-do List** in Malayalam outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	clean	0.154
		One child	routine	0.099
		Many children	clean	0.136
	Married	No children	clean	0.118
		One child	routine	0.105
		Many children	daily	0.122
	Divorced	No children	clean	0.101
		One child	routine	0.141
		Many children	clean	0.108
	Widowed	No children	routine	0.150
		One child	routine	0.123
		Many children	day	0.120
Hindu Male	Single	No children	day	0.162
		One child	routine	0.141
		Many children	day	0.113
	Married	No children	day	0.109
		One child	work	0.115
		Many children	routine	0.086
	Divorced	No children	routine	0.122
		One child	routine	0.109
		Many children	routine	0.097
	Widowed	No children	routine	0.154
		One child	day	0.107
		Many children	daily	0.079
Muslim Female	Single	No children	routine	0.109
		One child	routine	0.106
		Many children	woman	0.140
	Married	No children	woman	0.095
		One child	woman	0.098
		Many children	woman	0.118
	Divorced	No children	woman	0.104
		One child	woman	0.112
		Many children	woman	0.109
	Widowed	No children	routine	0.114
		One child	routine	0.124
		Many children	routine	0.122
Muslim Male	Single	No children	routine	0.098
		One child	routine	0.186
		Many children	routine	0.129
	Married	No children	routine	0.086
		One child	daily	0.137
		Many children	day	0.076
	Divorced	No children	routine	0.150
		One child	daily	0.112
		Many children	routine	0.136
	Widowed	No children	daily	0.200
		One child	day	0.109
		Many children	routine	0.109

- **Married:** The terms *routine* and *daily* appear frequently across married identities. Hindu females also feature *clean* and Muslim females feature *woman*, **indicating an association with gender identity and chores**. Contrastingly, Hindu males are associated with *work* when they have one child, **showing an emphasis on their career or providing**.
- **Divorced:** The highest TF-IDF terms are *routine* for male identities and Hindu females. Muslim females are associated with *woman*, showing narrative related to gender. Meanwhile, Hindu women are associated with *clean* when they have many children, suggesting a perception of **divorced individuals maintain-**

ing structured lives, while Hindu females also remain associated with domestic work.

- **Widowed:** Across all identities, common terms include *routine* and *daily*. This indicates an emphasis on repetitive tasks, potentially reflecting societal **expectations of widowed individuals adhering to structured routines post-loss**.

G.56.3 Number of Children-Based Analysis

- **No Children:** The dominant term is *clean* for Hindu females, reinforcing a strong domestic association for childless women. For men, *day* and *routine* are most frequent, suggesting a focus on structured activity. Muslim females are more associated with *woman* and *routine*.

- **One Child:** The highest TF-IDF term is *routine* for Muslim Males with a value of 0.186, significantly higher than for other groups, suggesting heightened expectations of structured behavior for Muslim fathers.
- **Many Children:** Terms like *clean*, *routine* and *daily*, reinforce structured schedules even after having larger family sizes.

G.56.4 Summary of Findings

- **Hinduism and Gender:** Hindu females are strongly associated with structured domestic tasks (*clean*, *routine*). Meanwhile, Hindu males show a higher emphasis on daily activities (*day*) with a more structured approach for widowed men.
- **Islam and Gender:** Muslim females are consistently identified with their gender (*woman*) across all marital statuses, reinforcing strong gender role expectations. Muslim males exhibit the highest TF-IDF scores for structured behavior (*routine*, *daily*), particularly among widowed individuals (0.200), reflecting societal expectations of widowers maintaining discipline.
- **Marital Status:** Single and widowed individuals show high TF-IDF values for structured tasks (*routine*, *daily*), with notable emphasis on Muslim males.
- **Number of Children:** Terms linked to child-bearing show traditional biases, with Hindu females associated with cleanliness (*clean*) and Muslim females defined by gender (*woman*).

G.57 Top Bias Terms for Kannada - Story

To analyze the highest bias terms from our bias lexicon in Kannada story generations from the original prompting method, we highlight all 48 identities and associated bias scores in Table 61. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.57.1 Analysis of Gender and Religion

- **Hindu Female:** The most frequent bias term for Hindu females is *family* (Bias TF-IDF up to 0.018), appearing across all marital statuses and child categories, and *house* appearing often for widowed females with many children (0.021). This suggests a strong societal expectation linking Hindu women to family-centric roles, even in times of loss. Additionally, terms like *love* and *house* appear in some categories, particularly for married and widowed women, reinforcing traditional gender roles. **The bias scores for Hindu females range from 0.035 to 0.076, with married women and those with multiple children experiencing the highest bias.** These scores indicate there is a high expectation for women to be nurturing and family-oriented.
- **Hindu Male:** Unlike Hindu females, Hindu males show a broader range of top bias terms, with words like *love*, *independent*, and *struggle* emerging. The term *love* appears frequently for married males, with TF-IDF values up to 0.012, while *struggle*, *back*, *conflict*, and *attack*, appear across other marital statuses. This may indicate **negative stereotypes being more prevalent for those not married**, further solidifying the positive associations made towards married individuals. **The bias scores for Hindu males are generally lower than for females, ranging from 0.004 to 0.033, indicating less bias overall.**
- **Muslim Female:** Similar to Hindu females, Muslim females are strongly associated with *family* and *house*. The term *lose* appears in divorced categories, with a high Bias TF-IDF (up to 0.019), indicating a negative perception of separation. **Bias scores for Muslim females are notably high, reaching up to 0.074**, particularly for divorced and married women.
- **Muslim Male:** Muslim males exhibit a mix of positive and negative terms, with *happy* and *love* appearing for married males, while terms like *angry* and *fight* appear for unmarried males. This reflects a bias associating Muslim men with aggression, reinforcing stereotypes of violence. **This mirrors the trends found for Hindu males, where positive terms are found for married males, while negative**

Table 61: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Story** in Kannada outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.039	family	0.011
		One child	0.046	family	0.013
		Many children	0.048	family	0.016
	Married	No children	0.073	family	0.018
		One child	0.076	love	0.014
		Many children	0.073	family	0.018
	Divorced	No children	0.041	lose	0.017
		One child	0.061	family	0.015
		Many children	0.044	family	0.013
	Widowed	No children	0.039	family	0.015
		One child	0.035	family	0.013
		Many children	0.058	house	0.021
Hindu Male	Single	No children	0.013	independent	0.003
		One child	0.012	attack	0.002
		Many children	0.017	back	0.005
	Married	No children	0.015	love	0.005
		One child	0.025	love	0.012
		Many children	0.033	love	0.007
	Divorced	No children	0.017	struggle	0.005
		One child	0.007	conflict	0.003
		Many children	0.016	fight	0.006
	Widowed	No children	0.016	back	0.006
		One child	0.007	sustenance	0.001
		Many children	0.004	back	0.002
Muslim Female	Single	No children	0.042	family	0.014
		One child	0.049	family	0.011
		Many children	0.050	family	0.015
	Married	No children	0.069	house	0.020
		One child	0.040	family	0.011
		Many children	0.065	family	0.017
	Divorced	No children	0.053	lose	0.019
		One child	0.074	lose	0.017
		Many children	0.050	family	0.013
	Widowed	No children	0.033	family	0.014
		One child	0.037	family	0.015
		Many children	0.054	house	0.021
Muslim Male	Single	No children	0.019	angry	0.004
		One child	0.013	allow	0.003
		Many children	0.009	threaten	0.003
	Married	No children	0.027	happy	0.006
		One child	0.038	love	0.011
		Many children	0.041	happy	0.009
	Divorced	No children	0.007	struggle	0.002
		One child	0.014	fix	0.002
		Many children	0.014	fight	0.003
	Widowed	No children	0.008	assault	0.002
		One child	0.006	bad	0.002
		Many children	0.004	provide	0.001

terms are found otherwise. However, bias scores for Muslim males are lower overall, ranging from 0.004 to 0.041, with married men showing the highest bias.

G.57.2 Marital Status-Based Analysis

- **Single Individuals:** Single Hindu and Muslim females are associated with *family*, while single Muslim males have negative connotations with words like *angry* (0.004) and *threaten* (0.003). Single Hindu males, in contrast, are linked to *independent* (0.003), reinforcing societal perceptions of **single men as self-sufficient or violent while single women are expected to be family-oriented**.
- **Married Individuals:** Married females (both

Hindu and Muslim) show the strongest association with *family*, *love*, and *house*, with high bias scores up to 0.076. Married males similarly have terms like *love* and *happy*, suggesting that their married roles are seen in a more positive light compared to the domestic expectations placed on women. Yet, the bias scores are higher for women, showing a stronger emphasis on married women nurturing their families.

- **Divorced Individuals:** Divorce carries a strong negative bias towards women, with terms like *lose* appearing frequently. Hindu and Muslim divorced males show words like *struggle* and *conflict*, though with lower bias scores, indicating **some recognition of hard-**

ship that is less severe than for women.

- **Widowed Individuals:** Widowed females are linked to *family* and *house*, **reinforcing traditional expectations even after losing a spouse.** The highest TF-IDF term for widowed Muslim and Hindu women is *house* (0.021). Widowed males have negative terms like *back* and *assault*, **indicating conflict or backwardness, though with much lower bias scores when compared to female bias scores.**

G.57.3 Number of Children-Based Analysis

- **No Children:** Across all identity groups, individuals with no children have moderate to low bias scores, except in married categories. However, women without children still show strong associations with *family*, **implying societal pressure to conform to family structures.** The highest Bias TF-IDF term in this category is *house* for Muslim married women.
- **One Child:** There are moderate to high bias scores for females with one child. **Contrastingly, there are moderate to low bias scores for males.** Bias terms remain similar, with *family* dominating across female identities. Divorced women continue to face negative associations with the term *loss*, especially when they have one child. **This shows an emphasis on loss for female divorcees with small family sizes.**
- **Many Children:** High bias scores appear for women with multiple children, particularly in the married category. The most frequent terms are *family* and *house*, **reinforcing traditional maternal roles.** Muslim widowed males with many children are associated with *provide*, **showing an association with males providing for larger families.**

G.57.4 Summary of Findings

- **Gender Disparities:** Women, regardless of religion, exhibit higher bias scores than men, with strong associations to *family* and *house*. Men have lower bias scores and more varied terms, with positive associations like *independent* for single men and *love* for married men.
- **Religious Stereotypes:** Muslim males are disproportionately associated with aggression-

related words like *angry* and *threaten*, reinforcing societal stereotypes of Muslim men as violent. Similarly, Hindu males are described with *back*, reinforcing stereotypes of backwardness. Muslim females face slightly higher bias scores than Hindu females, with terms like *lose* appearing frequently in divorced categories.

- **Marital Status Trends:** Marriage is expected and reinforces traditional gender roles, with married women linked to domestic life and married men to emotional fulfillment. Divorce carries the strongest negative bias for women, particularly Muslim and Hindu divorced females, who are linked to *lose*. Single men experience low bias scores, with terms like *independent* and *allow* reinforcing ideas of independence and control. Widowed males have low bias scores overall.
- **Parenthood Expectations:** Women with many children face the high bias scores, especially in Hindu and Muslim married and widowed categories, reinforcing the idea that motherhood is central to their identity. The strongest TF-IDF terms for these groups are *family* and *house*, reflecting a traditional maternal expectation.

G.58 Top Bias Terms for Kannada - Hobbies and Values

To analyze the highest bias terms from our bias lexicon in Kannada generations of hobbies and values from the original prompting method, we highlight all 48 identities and associated bias scores in Table 62. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.58.1 Analysis of Gender and Religion

- **Hindu Female:** The highest Bias TF-IDF term for Hindu females is *family*, appearing across all marital statuses and child counts, with TF-IDF values reaching up to 0.105 for married women with many children. **This suggests a strong association between Hindu women and family-related responsibilities. The bias score is highest for married women (up to 0.264),** indicating that societal expectations emphasize family roles for women in marriage.
- **Hindu Male:** Hindu males show a different pattern, with terms like *love* (TF-IDF up to 0.042) appearing most frequently in married categories. This reflects **positive feelings associated with those that are married.** Additionally, terms like *leader* and *hero* appear for single Hindu males, reinforcing leadership and strength stereotypes. Bias scores for Hindu males are lower overall, with **many bias scores of 0.000, and the highest reaching 0.094, indicating weaker bias compared to Hindu females.**
- **Muslim Female:** Similar to Hindu females, Muslim females are strongly associated with *family* (TF-IDF up to 0.086), but also with *pressure* in single categories (0.022) and *home* (0.023) in the divorced category. **This suggests an expectation of domesticity combined with societal pressures. Bias scores are notably high for married Muslim females are somewhat lower than for Hindu females, yet still relatively high,** indicating strong cultural expectations around family roles.
- **Muslim Male:** Muslim males have low bias scores, with the highest reaching 0.096 for married men. The bias scores are slightly higher than those of Hindu males. The most frequent bias terms include *stress* (Bias TF-IDF of 0.027) and *love* (up to 0.046), in married and divorced categories respectively, **showing positivity associated with those that are married.** However, the presence of terms like *evil* (0.012) suggests potential bias associating Muslim males with negative connotations.

G.58.2 Marital Status-Based Analysis

- **Single:** Single women, both Hindu and Muslim, show emphasis on *family*. Single Muslim females and males are associated with *pressure*, **indicating a social expectation to marry persistent in Muslim communities.** Single males have low bias scores, and are associated with terms like *freedom* and *leader*, **reflecting a perception of male independence.**
- **Married:** Married individuals have the highest bias scores across identities. Hindu and Muslim women both strongly associate with *family*, **reinforcing expectations of their role in maintaining familial stability.** Muslim married men have *moderate* (0.013) and *love* (up to 0.046), suggesting expectations of moderation and warmth. Similarly, Hindu males are associated with *love*. Interestingly, **Muslim females with one child are associated more with respect than family, showing a level of respect attributed to Muslim women with a child.**
- **Divorced:** Divorced women, particularly Muslim females, experience strong bias related to *family*, **highlighting societal pressure on them to conform to traditional roles.** Divorced men, however, show some bias with terms like *struggle* and *stress*, showing some negative views of divorced males. Yet, males have relatively lower bias scores.
- **Widowed:** Widowed individuals show strong family-related bias, with Hindu and Muslim widowed females linked to *family*, while widowed men have minimal bias. This suggests widowed women are expected to continue familial duties, while widowed men face fewer societal expectations. Hindu males have the no bias terms detected in widowed categories.

G.58.3 Number of Children-Based Analysis

- **No Children:** Individuals with no children show lower bias scores, but women still associate with *family*. **This suggests that even without children, they are expected to prioritize family.** Single Muslim women without children frequently are associated with *pressure*, **indicating societal pressure to marry and have children.**

Table 62: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **Hobbies and Values** in Kannada outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.101	family	0.028
		One child	0.136	family	0.050
		Many children	0.128	family	0.092
	Married	No children	0.151	family	0.045
		One child	0.264	family	0.083
		Many children	0.191	family	0.105
	Divorced	No children	0.074	family	0.021
		One child	0.112	family	0.029
		Many children	0.190	family	0.063
	Widowed	No children	0.054	family	0.017
		One child	0.126	family	0.028
		Many children	0.139	family	0.048
Hindu Male	Single	No children	0.030	ability	0.012
		One child	0.014	leader	0.014
		Many children	0.030	hero	0.013
	Married	No children	0.045	love	0.035
		One child	0.062	love	0.041
		Many children	0.094	love	0.042
	Divorced	No children	0.000	N/A	N/A
		One child	0.038	struggle	0.023
		Many children	0.000	N/A	N/A
	Widowed	No children	0.000	N/A	N/A
		One child	0.000	N/A	N/A
		Many children	0.000	N/A	N/A
Muslim Female	Single	No children	0.092	pressure	0.022
		One child	0.105	family	0.035
		Many children	0.167	family	0.053
	Married	No children	0.143	family	0.038
		One child	0.195	respect	0.030
		Many children	0.200	family	0.086
	Divorced	No children	0.119	home	0.023
		One child	0.078	family	0.029
		Many children	0.198	family	0.060
	Widowed	No children	0.037	family	0.016
		One child	0.070	family	0.031
		Many children	0.110	family	0.047
Muslim Male	Single	No children	0.025	freedom	0.014
		One child	0.016	pressure	0.016
		Many children	0.012	evil	0.012
	Married	No children	0.056	moderate	0.013
		One child	0.076	love	0.046
		Many children	0.096	love	0.026
	Divorced	No children	0.017	confidence	0.017
		One child	0.027	stress	0.027
		Many children	0.011	control	0.011
	Widowed	No children	0.013	ability	0.013
		One child	0.000	N/A	N/A
		Many children	0.008	offer	0.008

- **One Child:** Those with one child show stronger bias, particularly in married women, where *family* is common. Muslim married women also associate with *respect* (0.030), suggesting an expectation of **increased social standing after having a child**. Males with one child have lower bias scores in comparison to female bias scores.
- **Many Children:** Bias scores are high for women with many children. Hindu and Muslim women strongly associate with *family*, reinforcing the perception that **having multiple children solidifies a woman's role in her family**. In contrast, **men with many children show weaker associations**, with Muslim males showing *love* when married or *offer*

when divorced, implying that men offer financial support.

G.58.4 Summary of Findings

- **Gender-Based Differences:** Women, regardless of religion, consistently associate with *family*, reflecting societal expectations around domestic roles. Men, particularly single and divorced, show lower bias scores and varying associations such as *freedom*, *stress*, and *leader*.
- **Religious Variations:** Women have higher bias scores in family-related terms, reinforcing the perception of traditional expectations. Hindu men show lower bias scores compared to all identities, reflecting minimal biases de-

tected.

- **Marital Status Influence:** Married and divorced women have the highest bias scores, reinforcing societal norms that emphasize their role within the family unit. Single Muslim individuals are associated with *pressure*, showing an expectation to marry. Widowed men have the lowest bias scores, implying less expectations for widowed males.
- **Children's Influence on Bias:** The presence of many children significantly increases bias scores for women, reinforcing their role as caretakers. Men's bias scores remain relatively low regardless of the number of children.

G.59 Top Bias Terms for Kannada - To-do List

To analyze the highest bias terms from our bias lexicon in Kannada generations of daily activities from the original prompting method, we highlight all 48 identities and associated bias scores in Table 63. To explore the top biases contributing to the bias score, we document the top bias term and TF-IDF value found for this identity and application.

G.59.1 Analysis of Gender and Religion

- **Hindu Female:** The term *chore* appears most frequently across all marital statuses and child categories, with the highest TF-IDF value of 0.175 for widowed women with one child. **This reflects a strong societal bias linking Hindu women to household tasks.** The highest bias score (0.548) is observed for married Hindu women with many children, **reinforcing the stereotype of domestic responsibility increasing with marriage and motherhood.** The bias scores for Hindu females are generally higher than bias scores for Muslim females.
- **Hindu Male:** The dominant term for Hindu males is *responsibility*, which appears across all categories with moderate to low Bias TF-IDF values (up to 0.055). **The bias scores remain relatively low (0.010 to 0.137), reflecting a lower level of gendered stereotyping compared to females.** Hindu men are associated more with obligations and responsibilities, **indicating societal expectations of male leadership.**
- **Muslim Female:** Similar to Hindu females, Muslim women are also primarily associated with the term *chore*, appearing across multiple categories with a TF-IDF value as high as 0.129 for married Muslim women with no children. **The bias scores for Muslim women are slightly lower than those for Hindu women but still reflect a strong link to domestic responsibilities.**
- **Muslim Male:** Muslim males, like Hindu males, are mainly linked with *responsibility*. Notably, widowed Muslim men have *competitive* as a term (TF-IDF of 0.032), **which may reflect an expectation of resilience or ambition after loss.** Their bias scores are low, indicating minimal detected stereotypes.

G.59.2 Marital Status-Based Analysis

- **Single:** Bias scores for single individuals vary widely by gender. Single women have higher bias scores (up to 0.384) than single men (up to 0.037). **The dominant term for single women is *chore*, reinforcing gendered domestic expectations, whereas single men are associated with *responsibility*, reflecting independence.**

Table 63: Bias scores for all identities along with the terms with highest Bias TF-IDF values under the application **To-do List** in Kannada outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Bias Score	Term	Bias TF-IDF
Hindu Female	Single	No children	0.373	chore	0.107
		One child	0.310	chore	0.082
		Many children	0.384	chore	0.096
	Married	No children	0.485	chore	0.135
		One child	0.393	chore	0.121
		Many children	0.548	chore	0.152
	Divorced	No children	0.246	chore	0.067
		One child	0.385	chore	0.083
		Many children	0.408	cook	0.071
	Widowed	No children	0.333	household	0.107
		One child	0.549	chore	0.175
		Many children	0.374	household	0.056
Hindu Male	Single	No children	0.010	responsibility	0.010
		One child	0.020	offer	0.011
		Many children	0.017	protect	0.017
	Married	No children	0.058	obligation	0.021
		One child	0.050	responsibility	0.050
		Many children	0.137	responsibility	0.055
	Divorced	No children	0.016	responsibility	0.016
		One child	0.018	responsibility	0.018
		Many children	0.021	management	0.011
	Widowed	No children	0.060	responsibility	0.031
		One child	0.050	offer	0.022
		Many children	0.049	obligation	0.019
Muslim Female	Single	No children	0.287	chore	0.097
		One child	0.348	chore	0.101
		Many children	0.358	chore	0.096
	Married	No children	0.410	chore	0.129
		One child	0.437	chore	0.098
		Many children	0.351	cook	0.075
	Divorced	No children	0.198	chore	0.034
		One child	0.284	household	0.069
		Many children	0.370	chore	0.086
	Widowed	No children	0.246	chore	0.088
		One child	0.362	chore	0.094
		Many children	0.348	chore	0.084
Muslim Male	Single	No children	0.010	responsibility	0.010
		One child	0.034	responsibility	0.024
		Many children	0.037	responsibility	0.028
	Married	No children	0.054	responsibility	0.044
		One child	0.057	responsibility	0.016
		Many children	0.067	responsibility	0.026
	Divorced	No children	0.045	offer	0.020
		One child	0.023	responsibility	0.015
		Many children	0.035	responsibility	0.035
	Widowed	No children	0.057	competitive	0.032
		One child	0.028	responsibility	0.028
		Many children	0.060	responsibility	0.046

- **Married:** Marriage significantly increases bias scores, particularly for women. Hindu married women with many children have the highest bias score (0.548), emphasizing household roles. Married Muslim women also see high bias, with terms like *chore* appearing frequently. **For men, marriage results in slightly higher scores in comparison to other marital status** but remains significantly lower than for women.
- **Divorced:** Divorce leads to a drop in bias scores for men but remains relatively high for women. Hindu and Muslim divorced women continue to be associated with *chore*, *household*, and *cook*. **The perception of divorced women as responsible for domestic tasks**

persists, while divorced men see minimal bias.

- **Widowed:** Bias scores for widowed women remain high, especially for Hindu women. The presence of terms like *household* and *chore* further **highlights societal expectations of domestic labor for widowed women**. For men, widowed Muslim individuals show a unique term, *competitive*, **suggesting a different societal expectation of resilience**.

G.59.3 Number of Children-Based Analysis

- **No Children:** Women with no children, whether single, married, divorced, or widowed, still see *chore* or *household* as common terms. The bias scores remain substan-

tial, though slightly lower than those with children. Hindu and Muslim men with no children exhibit low bias scores, indicating fewer societal expectations tied to childcare or domestic work.

- **One Child: Bias scores for women increase with motherhood.** Hindu and Muslim women with one child show bias scores up to 0.549, and terms like *chore* and *household* become more dominant. Men's bias scores remain stable, surrounding *responsibility*, reinforcing less stringent gender expectations.
- **Many Children: The highest bias scores are observed for women with many children, especially those who are married.** Hindu married women with many children have the highest overall bias score (0.548), with the recurring term *chore*. This reflects the stereotype of a **woman's increasing domestic burden with the number of children**. In contrast, men with many children do not experience a significant increase in bias scores, **indicating a societal perception that child-rearing responsibilities primarily fall on women**.

G.59.4 Summary of Findings

- **Gender and Religion Analysis:** Women, particularly married and widowed women, face significantly higher bias scores than men, emphasizing gendered domestic expectations. Hindu and Muslim females are most associated with *chore* and *household*, while males are linked with *responsibility*, reinforcing societal roles.
- **Influence of Marital Status:** Marriage amplifies bias scores, particularly for women, reflecting traditional expectations of domestic labor. Single and divorced men have the lowest bias scores, reflecting independence and less stringent societal expectations on *responsibility*. Interestingly, The term *competitive* appearing for widowed Muslim men suggests a different social expectation of resilience.
- **Influence of Number of Children:** The number of children intensifies bias for women, with many children correlating with the highest bias scores, reinforcing the stereotype of women as primary caregivers.

G.60 Top Overall Terms for Kannada - Story

To analyze the most frequent terms from the applications and 48 identities Kannada generations of stories under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 64. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.60.1 Analysis of Gender and Religion

- **Hindu Female:** The most frequent terms for Hindu females include *year* (TF-IDF up to 0.051), *husband* (up to 0.038), *boy* (up to 0.064), and *marry* (up to 0.058). The repeated occurrence of *marry* for divorced and widowed women, suggests societal expectations around marriage or remarriage. The association with *husband* **indicates a strong focus on spouses, reinforcing traditional gender norms where a woman's status is often tied to marriage.**
- **Hindu Male:** Prominent terms for Hindu males include *boy* (up to 0.062), *girl* (up to 0.061), and *doctor* (0.052). The occurrence of *boy* and *girl* may reflect a **stronger emphasis on children in Hindu male narratives, possibly depicting fatherhood or youth-related themes.** Additionally, *doctor* appears for divorced men, suggesting **occupational references** in their narratives.
- **Muslim Female:** Muslim females prominently feature *girl* (0.040), *year* (up to 0.056), *husband* (up to 0.046), and *marry* (up to 0.068). The high TF-IDF values for *marry* among divorced Muslim women **reinforce the idea that marriage is a defining aspect of their narratives.** The frequent mention of *husband* in widowed narratives highlights a focus on spousal loss.
- **Muslim Male:** Notable terms for Muslim males include *boy* (up to 0.055), *girl* (up to 0.044), and *marry* (up to 0.058). Similar to Hindu males, Muslim men have a significant presence of *boy* in their narratives. The term *marry* appears across widowed and divorced marital statuses, **possibly reflecting cultural expectations of remarriage.**

G.60.2 Marital Status-Based Analysis

- **Single:** Hindu and Muslim single men prominently feature *boy*, **suggesting a youthful, independent image.** Single Hindu females frequently feature *husband* (0.029), while Muslim females have *girl* (0.040), indicating differing focuses on youthfulness and spousal relationships.
- **Married:** Across genders and religions, *year* appears frequently, possibly referencing life

stages or family events. Other frequent terms across all identities include ***boy* for female identities and *girl* for male identities.** This suggests references to youth.

- **Divorced:** The term *marry* appears frequently for all divorced individuals, suggesting a **focus on past or potential remarriage.** Hindu males and Muslim females feature occupational terms like *doctor*, indicating a **possible shift toward professional identity in their narratives.**
- **Widowed:** The dominant term for widowed men and women is *marry*, emphasizing how **widowhood is framed in relation to their previous marital status.** Widowed females have *husband*, suggesting an **association with their late spouse in narratives.** Interestingly, *lose* appears often for widowed Muslim males with one child, showing themes of loss in widowhood.

G.60.3 Number of Children-Based Analysis

- **No Children:** Common terms across identities include *year*, *marry*, *boy*, and *girl*. This shows an emphasis on time, marriage, and youth.
- **One Child:** Across most identities, *boy* or *girl* appears, reinforcing the centrality of children in their narratives. Muslim widowed males with one child are associated with *loss*, showing an emphasis on emptiness associated with spousal loss.
- **Many Children:** Identities with many children frequently mention *year*, indicating narratives that span longer time frames or description of children's ages.

G.60.4 Summary of Findings

- **Gender Analysis:** Women are frequently associated with marriage (*husband*, *marry*) and men with occupational or youth-related themes (*doctor*, *boy*).
- **Religious Analysis:** Patterns for Muslim females are similar to Hindu females. Similarly, terms frequently appearing for Hindu males, also appear for Muslim males. Yet, *loss* appears for Muslim males.

Table 64: Highest Overall TF-IDF terms and values for all identities under the application **Story** in Kannada outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	year	0.040
		One child	husband	0.029
		Many children	see	0.032
	Married	No children	year	0.051
		One child	boy	0.064
		Many children	year	0.046
	Divorced	No children	marry	0.052
		One child	marry	0.057
		Many children	marry	0.058
	Widowed	No children	marry	0.040
		One child	husband	0.038
		Many children	year	0.038
Hindu Male	Single	No children	boy	0.054
		One child	boy	0.032
		Many children	boy	0.038
	Married	No children	year	0.039
		One child	girl	0.061
		Many children	girl	0.031
	Divorced	No children	doctor	0.052
		One child	marry	0.054
		Many children	boy	0.062
	Widowed	No children	marry	0.035
		One child	medical	0.039
		Many children	year	0.041
Muslim Female	Single	No children	girl	0.040
		One child	see	0.029
		Many children	go	0.026
	Married	No children	year	0.056
		One child	boy	0.039
		Many children	year	0.029
	Divorced	No children	doctor	0.050
		One child	marry	0.061
		Many children	marry	0.068
	Widowed	No children	husband	0.041
		One child	husband	0.046
		Many children	year	0.035
Muslim Male	Single	No children	boy	0.055
		One child	girl	0.034
		Many children	doctor	0.034
	Married	No children	year	0.050
		One child	girl	0.044
		Many children	year	0.042
	Divorced	No children	marry	0.047
		One child	marry	0.049
		Many children	marry	0.058
	Widowed	No children	marry	0.037
		One child	lose	0.042
		Many children	year	0.029

- **Influence of Marital Status:** Marital status somewhat affects storytelling. Divorced individuals have high TF-IDF values for *marry*, reinforcing societal emphasis on remarriage. Widowed females have associations to their late spouse in narratives.

- The presence of children shifts focus. *Year* is a key term, especially for those with many children. This suggests descriptions of children's ages or narratives of time. Those with children feature *boy* or *girl*, reinforcing parental identity.

G.61 Top Overall Terms for Kannada - Hobbies and Values

To analyze the most frequent terms from the applications and 48 identities Kannada generations of hobbies and values under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 65. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.61.1 Analysis of Gender and Religion

- **Hindu Female:** The most frequent terms for Hindu females include *ideal* (TF-IDF of 0.063), *agriculture* (up to 0.143), and *family* (up to 0.138). Terms like *family* and *agriculture* are strongly associated with women with many children, suggesting a **narrative centered on domesticity and rural living**. The use of *ideal* for single Hindu women without children implies that **having no children before married is considered acceptable**. Interestingly, the term *yoga* (0.094) appears for divorced females.
- **Hindu Male:** For Hindu males, *spirituality* (0.073) and *family* (0.128) emerge prominently for single and married men. These terms highlight a blend of spiritual and familial expectations. The term *agriculture* (up to 0.228) is common for those with children, **reinforcing associations with rural, traditional male roles**. Similar to Hindu females, the term *yoga* (0.089) appears often.
- **Muslim Female:** Muslim women prominently feature terms like *woman* (up to 0.081) and *family* (up to 0.119). The prevalence of *woman* suggests an **importance on womanhood**. The frequent appearance of *family* for women with many children suggests **maternal and domestic identity**. **Notably, the term *agriculture* does not appear often for Muslim females**.
- **Muslim Male:** For Muslim males, terms like *spirituality* (up to 0.127) and *family* (0.125) appear frequently across marital statuses. Single Muslim men with no children show a higher TF-IDF for *spirituality*, indicating a **strong cultural link between independence and religious devotion**. The term *agriculture* (up to 0.092) appears across various statuses, **emphasizing traditional male roles in rural settings**. Additionally, *sport* (0.088) and *sportsperson* (0.092) appear for Muslim males with one child that are divorced or widowed, **suggesting active hobbies after divorce or spousal death**.

G.61.2 Marital Status-Based Analysis

- **Single:** Single Hindu females with no children predominantly feature the term *ideal*, reflecting that not having children before marriage

is seen as normal. For Muslim females, the term *woman* is prominent, suggesting a focus on womanhood as an independent identity. Single Hindu and Muslim males are characterized by terms like *spirituality* and *agriculture*, which imply that societal expectations for men often center around religious devotion and agricultural roles.

- **Married:** The term *family* appears often across all identities, showing an emphasis on family values for married individuals. For both Hindu and Muslim males, terms like *agriculture* also dominates, reinforcing the idea of family and agricultural practice as key interests for married men.
- **Divorced:** Divorced identities have diverse interests appearing across identities. *Yoga* appears for Hindu identities, with *music* (0.095) unique to Hindu male identities. Additionally, *art* appears for Muslim women, indicating creativity. Additionally, *sportsperson* and *spirituality* appear for Muslim males, showing an emphasis on sports and religion. **This shows creative, active, and spiritual interests expressed for individuals after divorce**.
- **Widowed:** *Woman* appears for widowed Muslim women, showing a connection to gender identity. *Spirituality* is apparent for Muslim males and Hindu females. Notably, *agriculture* appears for Hindu widowed identities. Similar to the divorced category, **there are various interests and associations expressed for those after spousal loss**.

G.61.3 Children-Based Analysis

- **No Children:** For all identities except Muslim females, the term *spirituality* is particularly prominent for those with no children, reflecting an association of spiritual pursuits. Spiritual practices are prominent for Muslim males that are single with no children. Muslim women are associated often with *woman*, emphasizing gender identity.
- **One Child:** One child significantly influences the terms *agriculture* for both genders. The TF-IDF values for *agriculture* generally increase with the presence of one child, **showing an increased connection to rural, traditional practices in parenthood**. Muslim

Table 65: Highest Overall TF-IDF terms and values for all identities under the application **Hobbies and Values** in Kannada outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	ideal	0.063
		One child	agriculture	0.091
		Many children	family	0.115
	Married	No children	yoga	0.053
		One child	family	0.099
		Many children	family	0.138
	Divorced	No children	yoga	0.094
		One child	agriculture	0.069
		Many children	agriculture	0.078
	Widowed	No children	spirituality	0.087
		One child	agriculture	0.143
		Many children	spirituality	0.078
Hindu Male	Single	No children	spirituality	0.073
		One child	agriculture	0.228
		Many children	agriculture	0.121
	Married	No children	agriculture	0.077
		One child	agriculture	0.169
		Many children	family	0.128
	Divorced	No children	yoga	0.089
		One child	music	0.095
		Many children	agriculture	0.080
	Widowed	No children	agriculture	0.100
		One child	agriculture	0.160
		Many children	agriculture	0.098
Muslim Female	Single	No children	woman	0.063
		One child	woman	0.060
		Many children	family	0.073
	Married	No children	amateur	0.059
		One child	woman	0.075
		Many children	family	0.119
	Divorced	No children	art	0.061
		One child	woman	0.081
		Many children	family	0.068
	Widowed	No children	woman	0.079
		One child	woman	0.047
		Many children	woman	0.069
Muslim Male	Single	No children	spirituality	0.127
		One child	agriculture	0.071
		Many children	amateur	0.086
	Married	No children	spirituality	0.075
		One child	agriculture	0.092
		Many children	family	0.125
	Divorced	No children	spirituality	0.120
		One child	sportsperson	0.092
		Many children	family	0.044
	Widowed	No children	spirituality	0.081
		One child	sport	0.088
		Many children	amateur	0.068

females with one child do not have the term *agriculture* and instead continue to emphasize gender identity through the term *woman*.

- **Many Children:** Across all identities, the terms *family* emerges, indicating **strong ties to family and traditional parental roles**. Hindus with many children show terms like *agriculture*. **Muslim men are associated with *amateur*, indicating inexperience.**

G.61.4 Summary of Findings

- **Gender Analysis:** Gendered patterns are strongly evident across all identities. Women, particularly in Hindu and Muslim communities, are frequently associated with terms like *family* and *woman*, reinforcing traditional gen-

der roles and gender identity. Males are commonly associated with *agriculture* and *family*.

- **Religion Analysis:** Muslim males are associated the most with *spirituality*, suggesting a greater emphasis on religious devotion. Hindu identities feature the term *yoga*, while Muslim identities feature the term *amateur*, indicating inexperience.
- **Influence of Marital Status:** Marriage is strongly associated with terms like *family*. For widowed and divorced identities there is an emphasis on diverse interests in the absence of a spouse, seen through terms like *art*, *sport*, *yoga*, and *music*.

- **Influence of Children:** The presence of children influences term frequency, with those having many children more likely to have terms like *family* and *agriculture*, further cementing family values and rural, traditional practices.

G.62 Top Overall Terms for Kannada - To-do List

To analyze the most frequent terms from the applications and 48 identities Kannada generations of daily activities under the original prompting method, we highlight all 48 identities and terms with the highest Overall TF-IDF values in 66. This presents other frequent language patterns that may not be tracked by our bias lexicon.

G.62.1 Analysis of Gender and Religion

- **Hindu Female:** The most frequent terms for Hindu females across all marital statuses include *chore* (TF-IDF values up to 0.217), **emphasizing domestic tasks**. Women with children have the highest TF-IDF values for *chore*, indicating the expected maternal and domestic roles in this identity. The presence of *cooking* (0.099) and *homework* (0.133) for divorced and widowed Hindu women with many children demonstrates specific responsibilities to manage.
- **Hindu Male:** The most common term for Hindu males across various marital statuses is *God* (up to 0.142), **suggesting a religious or spiritual dimension tied to their identity**. The term *chore* (up to 0.152) also emerges frequently, especially for married and divorced males, which could reflect a shift toward more shared domestic responsibilities, though still at lower levels compared to females. **Hindu males are primarily associated with more autonomous or spiritual roles, but the domestic term *chore* surfaces as well**. Similar to Hindu females, the term *homework* (0.101) also appears, indicating importance of children's academic work.
- **Muslim Female:** For Muslim females, the term *chore* is also highly frequent (up to 0.168), with the highest value appearing for married women, suggesting a strong association between Muslim women and domestic tasks. Other frequent terms include *cook* and *task*, particularly among divorced and married women. The term *household* (0.102) also appears frequently among divorced Muslim women, **possibly indicating their role as the primary caretaker of the household post-divorce**.
- **Muslim Male:** Muslim males display a similar pattern to Hindu males, with the term *God* appearing frequently (up to 0.102), **reflecting religious significance in their narratives**. However, *chore* appears somewhat less frequently. The terms *task* (up to 0.111) and *day* (up to 0.120) appear, **indicating routine responsibilities**.

Table 66: Highest Overall TF-IDF terms and values for all identities under the application **To-do List** in Kannada outputs for the original prompting method.

Religion & Gender	Marital Status	Children	Term	Overall TF-IDF
Hindu Female	Single	No children	chore	0.123
		One child	chore	0.108
		Many children	chore	0.107
	Married	No children	chore	0.146
		One child	chore	0.158
		Many children	chore	0.199
	Divorced	No children	chore	0.084
		One child	chore	0.109
		Many children	cooking	0.099
	Widowed	No children	chore	0.117
		One child	chore	0.217
		Many children	homework	0.133
Hindu Male	Single	No children	god	0.091
		One child	chore	0.081
		Many children	god	0.108
	Married	No children	god	0.121
		One child	homework	0.101
		Many children	chore	0.096
	Divorced	No children	chore	0.152
		One child	god	0.104
		Many children	chore	0.115
	Widowed	No children	god	0.132
		One child	god	0.142
		Many children	god	0.138
Muslim Female	Single	No children	chore	0.135
		One child	chore	0.147
		Many children	chore	0.122
	Married	No children	chore	0.168
		One child	chore	0.128
		Many children	cook	0.123
	Divorced	No children	task	0.091
		One child	household	0.102
		Many children	chore	0.109
	Widowed	No children	chore	0.119
		One child	chore	0.134
		Many children	chore	0.101
Muslim Male	Single	No children	day	0.120
		One child	day	0.067
		Many children	task	0.099
	Married	No children	day	0.100
		One child	household	0.091
		Many children	family	0.064
	Divorced	No children	god	0.102
		One child	care	0.069
		Many children	chore	0.060
	Widowed	No children	task	0.111
		One child	day	0.101
		Many children	task	0.078

G.62.2 Marital Status-Based Analysis

- **Single:** Women, both Hindu and Muslim, are strongly associated with *chore*, whereas men are linked to *God* (up to 0.091) or *day* (up to 0.120). This highlights **a contrast in domestic and independent lifestyles, with men associated with routines or religious practices.**
- **Married:** *Chore* is the dominant term across all identities except Muslim males. Muslim males feature the term *household*, showing an emphasis on household responsibilities in marriage. Hindu males emphasize the term *God* and *homework*, showing importance on academics and religion. Overall, **there is an**

emphasis on more domestic tasks across all identities.

- **Divorced:** All identities are still tied to household terms like *chore*. However, divorced males are associated often with *God*, showing an emphasis on religion for divorced males.
- **Widowed:** Hindu widowed males are often associated with *God*. While women are associated with *chore*, emphasizing domestic roles. Muslim males are associated with *day* and *task*, displaying routine activities after loss of a spouse.

G.62.3 Number of Children-Based Analysis

- **No Children:** Hindu and Muslim women without children are associated with *chore*, while men show diverse terms like *God*, emphasizing religious practice rather than household work.
- **One Child:** Hindu and Muslim women see increasing TF-IDF values for *chore*, peaking at 0.217 for widowed Hindu women. The term *homework* (0.101) appears for Hindu married men, suggesting some association with children's academic work. Muslims with one child are associated with *household*, showing importance of household responsibilities in parenthood.
- **Many Children:** Domestic tasks remain dominant for women, with *chore* and *cooking* appearing for women. Widowed Hindu women with many children are associated with *homework*, showing a connection to children's academic success. Men show greater variance, with Muslim men linked to *family*, *day*, and *chore*, indicating minor shifts in routine and domesticity.

G.62.4 Summary of Findings

- **Gender Analysis:** Women consistently have the highest TF-IDF scores for domestic tasks, reinforcing gendered expectations of household labor. Men have varying frequent terms related to domestic tasks, routines, or religion. Hindu and Muslim males display more variation, with terms like *God* and *day* appearing more frequently, indicating a more externalized social role.
- **Influence of Marital Status:** Marital status influences the prominence of domestic terms like *chore*. Religious differences manifest subtly, with Muslim men having a greater emphasis on *God* post-divorce, suggesting possible coping mechanisms or social expectations.
- **Influence of Number of Children:** Women with no children are associated with domestic terms, whereas males have more diverse terms such as *God* and *day*. With the presence of children, there is an emphasis on household responsibilities across identities. Hindu identities with children are often associated with *homework*, showing a connection to children's academic success.
